In further experiments we compared the cellular composition of the thymus from female H-2<sup>b/d</sup> and H-2<sup>d</sup>  $\alpha\beta$ -transgenic SCID mice. Because the transgenic TCR would essentially be the only receptor which could be used by the animals, one might expect that the H-2<sup>b/d</sup>, but not the H-2<sup>d</sup> animals, would contain CD4<sup>8</sup> thymocytes, if an interaction of the TCR with MHC antigens was essential for the generation of mature T cells. Double staining with CD4 and CD8 antibodies showed that this was indeed the case: the thymus of the H-2<sup>b/d</sup> transgenic SCID mice contained CD4<sup>8</sup>, CD4<sup>8</sup>, CD4<sup>8</sup> but not CD4<sup>8</sup> cells whereas that of the H-2<sup>d</sup> transgenic SCID mice contained

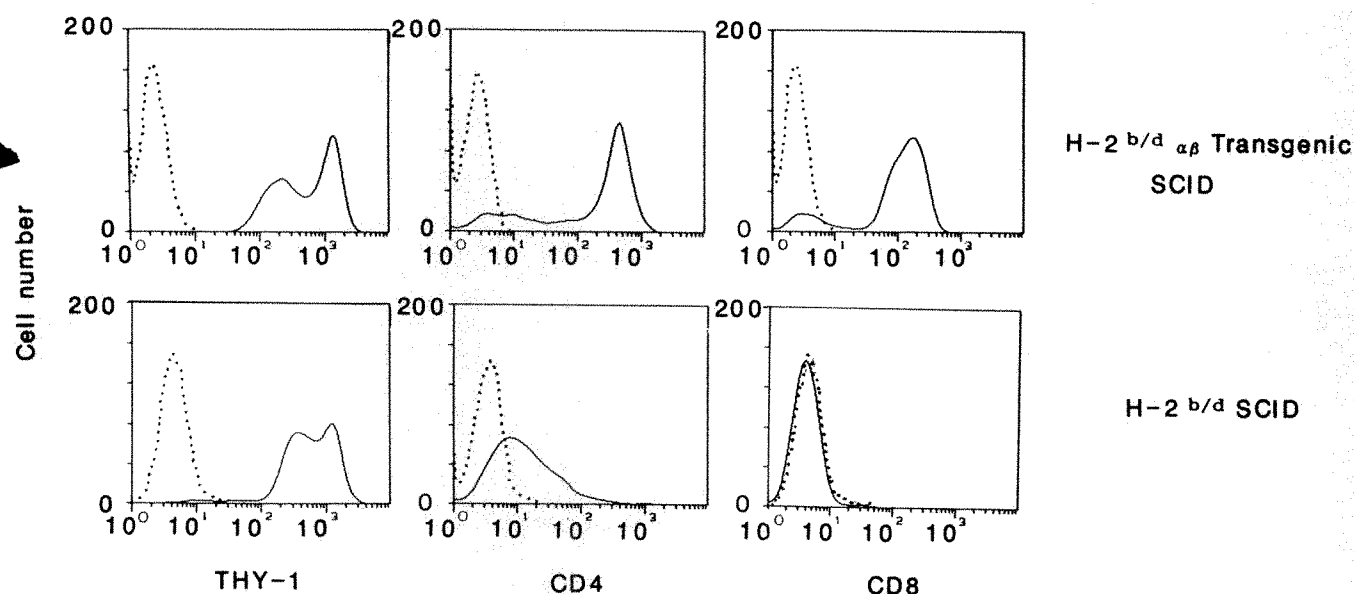

FIG. 1 Generation of CD4<sup>+</sup> and CD8<sup>+</sup> thymocytes in  $\alpha\beta$ -transgenic SCID mice. Thymocytes from female H-2<sup>b/d</sup>  $\alpha\beta$ -transgenic SCID (upper panels) and H-2<sup>b/d</sup> SCID mice (lower panels) were analysed for the expression of Thy-1, CD4 and CD8. Cell numbers are represented on the vertical axis and fluorescence, on a logarithmic scale, on the horizontal axis. The low level of CD4 staining of thymocytes from SCID mice is probably due to the non-specific binding of this reagent to large lymphoblasts which predominate

in the SCID thymus.

**METHODS.** Single staining of cells involved either incubation with a directly labelled antibody (CD4 or CD8) or a first stage antibody (anti-Thy-1, F23.1 or T3.70) followed by a second stage FITC conjugated (Fab)<sub>2</sub> sheep antimouse immunoglobulin (FITC-SαMlg, Silenus). All incubations were for 20 min on ice with two washes between the steps and before analysis.

CD4<sup>-</sup> and CD4<sup>+</sup> but neither CD4<sup>-</sup> nor CD4<sup>+</sup> cells (Fig. 2). Staining with the F23.1 (not shown) and T3.70 monoclonal antibodies detecting the transgenic  $\beta$  and  $\alpha$ TCR chains, respectively<sup>7</sup> indicated that in the various transgenic SCID mice practically all thymocytes expressed the transgenic receptor. The H-2<sup>b/d</sup>  $\alpha\beta$ -transgenic SCID mice contained two populations of cells expressing high levels of the transgenic  $\alpha\beta$ -receptor, namely CD4<sup>-</sup> and CD4<sup>+</sup> thymocytes. The only population with a high density of TCRs was the CD4<sup>-</sup> population in H-2<sup>d</sup> transgenic SCID mice. Both types of animals contained CD4<sup>+</sup> thymocytes expressing lower levels of the transgenic TCR<sup>1,2</sup>. Similar results were obtained in additional two H-2<sup>b/d</sup> and four H-2<sup>d</sup>  $\alpha\beta$ -transgenic SCID mice. Thus, by contrast with  $\alpha\beta$ -transgenic H-2<sup>d</sup> mice, the thymus of H-2<sup>d</sup>  $\alpha\beta$ -transgenic SCID mice does not contain significant numbers of mature CD4<sup>+</sup> or CD4<sup>+</sup> thymocytes. This indicates that the generation of mature, single, positive thymocytes requires a TCR-

MHC interaction and that positive selection does not simply reflect the preferential expansion of some mature T cells.

The size of the thymuses in the  $\alpha\beta$ -transgenic SCID mice was almost normal whereas the peripheral lymphoid tissue in all transgenic SCID mice was clearly underdeveloped: the lymph nodes of these mice contained on average only 10 % of lymphocytes when compared with  $\alpha\beta$ -transgenic mice kept under identical conditions. Double staining with various antibodies showed that the lymphocytes from only H-2<sup>b/d</sup> mice contained significant numbers of CD4<sup>-</sup> T cells which stained with both F23.1 and T3.70 antibodies. H-2<sup>d</sup> transgenic SCID mice contained very few CD4<sup>+</sup> cells and most of these did not express the transgenic  $\alpha$ -chain. Both types of animals contained over 20 % of CD4<sup>-</sup> lymphocytes expressing the transgenic receptor. Finally, in H-2<sup>b/d</sup> as well as H-2<sup>d/d</sup> mice, ~30% of CD4<sup>+</sup> T cells were detected which expressed mostly the transgenic  $\beta$ - but not the transgenic  $\alpha$ -chain (Fig. 3). Immunoglobulin-

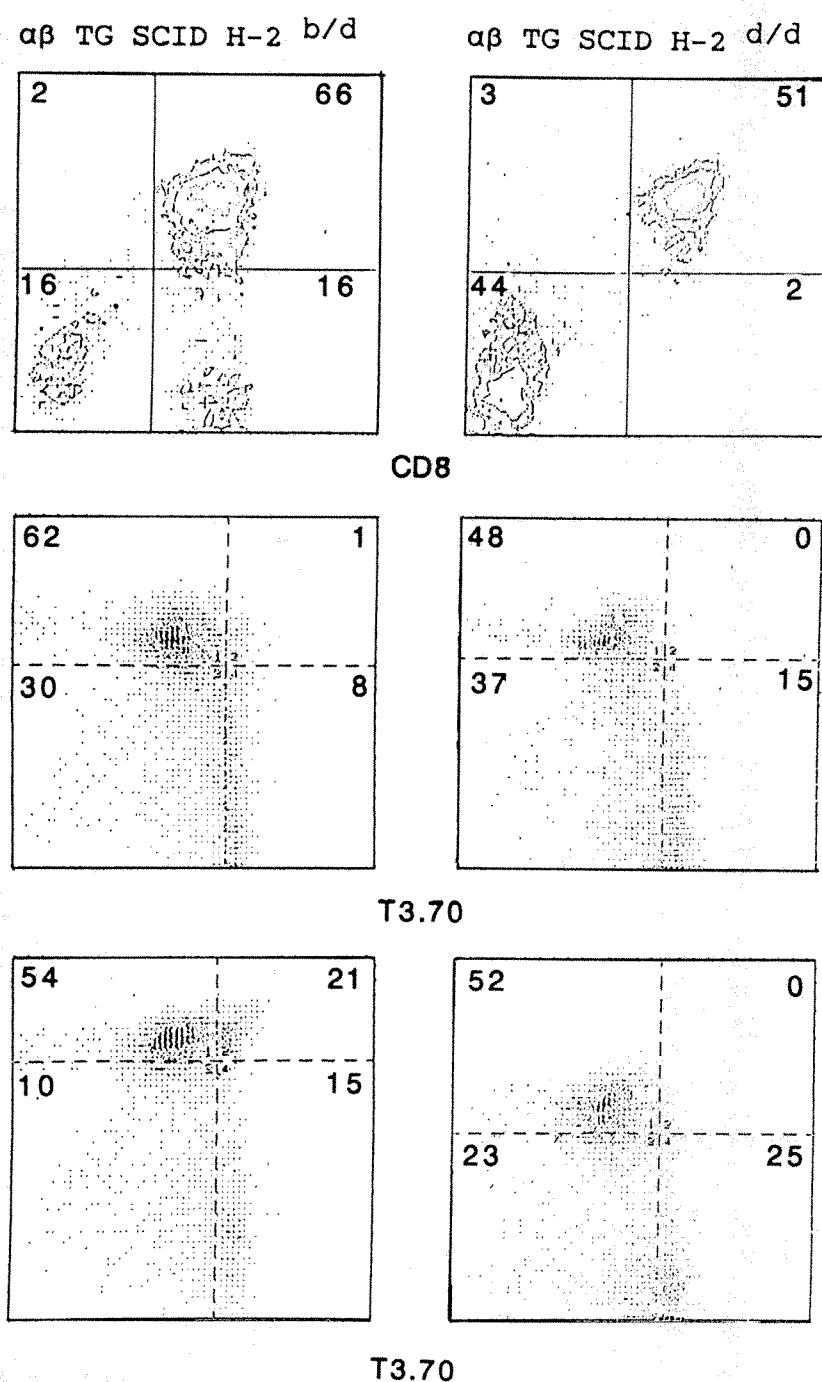

FIG. 2 Thymocyte subpopulations defined by CD4, CD8 and T3.70 antibodies. Thymocytes from female H-2<sup>b/d</sup> and H-2<sup>d/d</sup>  $\alpha\beta$ -transgenic SCID mice were double stained with CD4/CD8, CD4/T3.70 and CD8/T3.70 antibodies. Numbers in quadrants give the percentage of cells in the quadrants. The conditions of staining and the antibodies have been described previously<sup>1,2</sup>.

**METHODS.** Double labelling of cells involved a first stage incubation with either F23.1 or T3.70 followed by a second incubation with FITC-SaMlg. Potentially free sites for binding of immunoglobulin on the fluoresceinated reagent were saturated by a third incubation with normal mouse serum (2% v/v). The cells were then incubated with either PE-anti CD4 or biotinylated anti-CD8 antibodies. Cells incubated with the latter required a final stage of PE-streptavidin (Becton Dickinson). All incubations were for 20 min on ice with two washes between each step and before analysis. All analyses were performed on the FACScan flow cytometer (Becton Dickinson). Single staining required the analysis of 5,000 cells per sample; double staining required 10,000 cells per sample. Dead cells were excluded from the analyses on the basis of low, forward and sideways, light-scattering properties. All graphs were produced from the use of FACScan research software except the contour plots which utilized a CONSORT-30 program.

FIG 3 Lymphocyte subpopulations defined by CD4, CD8, F23.1, and T3.70 antibodies. Lymphocytes from female H-2<sup>b/d</sup> and H-2<sup>d</sup>  $\alpha\beta$ -transgenic SCID mice were double stained with CD4/F23.1, CD4/T3.70, CD8/F23.1 and

CD8/T3.70 antibodies. Numbers in the quadrants give the percentage of lymphocytes in the quadrants. Conditions of staining and the antibodies have been described previously<sup>1,2</sup>.

positive cells were not detected in any of the lymphocytes. These data indicate that productive rearrangements are made infrequently in SCID mice. In non-transgenic SCID mice this is not often observed because the formation of a receptor-bearing lymphocyte requires several consecutive productive rearrangements in a given lineage. In the transgenic SCID mice, productive  $\alpha$ -gene rearrangements are much easier to detect because the endogenous  $\alpha$ -chain can pair with the transgenic  $\beta$ -chain, the formation of which would require two productive rearrangements in non-transgenic SCID mice. This is probably the reason why we see T cells expressing endogenous  $\alpha$ TCR chains but cannot detect significant numbers of B cells, which again would require multiple productive rearrangements of endogenous immunoglobulin receptor gene segments. Because we cannot detect significant numbers of CD4<sup>+</sup>8<sup>+</sup> or CD4<sup>+</sup>8<sup>+</sup> thymocytes expressing endogenous  $\alpha$ -chains in the H-2<sup>d</sup>  $\alpha\beta$ -transgenic SCID mice, we conclude that very few cells of these phenotypes are generated. But when they are and express a selectable receptor, they leave the thymus and accumulate in the peripheral lymphoid tissue.

This is in marked contrast to CD4<sup>+</sup>8<sup>+</sup> cells expressing high levels of TCR. These cells are at least as frequent in the thymus and periphery in H-2<sup>d</sup> as in H-2<sup>b/d</sup>  $\alpha\beta$ -transgenic SCID mice even though they express the same  $\alpha\beta$ -transgenic receptor. Thus the generation of  $\alpha\beta$  TCR positive CD4<sup>+</sup>8<sup>+</sup> peripheral T cells does not require positive selection by restricting D<sup>b</sup> MHC antigens.

As  $\alpha\beta$ -T-cells are produced in the SCID mice in the absence

of detectable  $\gamma\delta$  cells it seems that the latter do not play an essential part in the development of CD4<sup>+</sup>8<sup>+</sup>, CD4<sup>+</sup>8<sup>+</sup> or CD4<sup>+</sup>8<sup>+</sup> T cells. This does not exclude  $\gamma\delta$ -cells from being essential for the formation of cells expressing rearranged TCR  $\beta$ -genes because our mice contain already rearranged  $\beta$ -genes.

Finally, the underdeveloped tissue of secondary lymphoid organs in H-2<sup>b/d</sup>  $\alpha\beta$ -transgenic SCID mice deserves some comment: in these mice CD4<sup>+</sup>8<sup>+</sup> cells are continuously positively selected in thymus yet the absolute numbers of peripheral lymphocytes are small. This suggests that the formation of peripheral lymphoid tissue requires immunoglobulin positive lymphocytes as well as CD4<sup>+</sup>8<sup>+</sup> T cells with a diverse range of receptors. Thus, antigenic stimulation and interaction of various lymphocyte subsets may be an important factor regulating the size of lymphoid tissue. □

SINCE insulin was first shown by Scott<sup>1</sup> to crystallize in the presence of zinc ions in 1934, a variety of Zn-containing insulin crystals have been grown<sup>2,3</sup>. The structures of insulin in the related rhombohedral crystals of 2Zn-insulin and 4Zn-insulin have been solved<sup>4,5</sup> and reveal that the molecule is a hexamer, organized as three dimers, each containing a 2-fold symmetry axis and held together by Zn ions. In 2Zn-insulin the hexamer is nearly symmetrical with the two axial Zn ions and the two molecules of the dimer related closely by a local 2-fold axis. But in 4Zn-insulin the two molecules in the dimer differ remarkably, creating an asymmetric 4Zn-hexamer in which one trimer is essentially equivalent to that in 2Zn-insulin and the other is different by virtue of an additional stretch of N-terminal helix between residues B1 and B8 (refs 6, 7). We report here the structure of a new symmetrical hexamer, in which all six molecules have the B1-B8 helix seen in 4Zn-insulin. Phenol molecules, found bonding specifically to each molecule, evidently stabilize this new helical conformation.

The existence of a symmetrical hexamer in which all six insulin molecules have a helical conformation from B1-B20 has been predicted<sup>8,9</sup> and the capacity of phenol to promote this helix in solution has been observed<sup>10</sup>. Monoclinic crystals of hexameric insulin grown in the presence of phenol, added as a preservative, have long been known<sup>2</sup> and it was from these that the new hexamer was discovered. The space group is  $P2_1$  and the crystals contain a complete hexamer in the asymmetric unit (Table 1). The chemical analysis of these crystals showed that they contained two Zn ions per insulin hexamer<sup>2</sup>, which suggested they were related in a simple manner to that of the rhombohedral 2Zn-insulin hexamer.

A full X-ray analysis of these crystals was originally under-

taken to investigate the loss of 3-fold symmetry in the hexamer and its effect upon the conformation of each of the monomers. Early experiments to prepare heavy-atom derivatives had limited success (J. Dargay, D. Hodgkin and G.G.D., unpublished observations). The structure was determined by molecular replacement, using the accurate 2Zn-insulin coordinates<sup>11</sup> as an initial model, and refined<sup>12,13</sup>. During the refinement it became clear that the hexamer in the crystal was different from the assumed 2Zn-insulin model, primarily at residues B1-B8. Inspection of the difference Fourier maps revealed electron density tracing a helix from B9-B1 in all six molecules, reminiscent of that seen in one trimer of the rhombohedral 4Zn-insulin hexamer (see Fig. 1). Consequently, a new hexamer was constructed using six monomers with properly oriented  $\alpha$ -helices from B1-B20.

As the refinement converged, a large region of strong electron density, obviously not water, was identified next to each of the B5 His side-chains. Continued refinement with the 1.8 Å data resulted in a map in which the phenol molecules were mostly well resolved and the positions of their hydroxyl groups clearly indicated (see Fig. 2). Each of the six phenol molecules donates a hydrogen bond to the A6 Cys carbonyl oxygen and accepts a hydrogen bond from the All Cys amide nitrogen. The phenol molecules sit in the cavity created by the A-chain residues from one dimer and the B1-B8 helical structure from the adjacent dimer. This allows the B5 His to link the dimers through van der Waal's contacts with the phenol molecule; in 4Zn-insulin, the same effect is achieved by the off-axial Zn ions. As shown in Fig. 1 there is a clear progression in the amount of helix present between residues B1 and B20 in the hexamers in rhombohedral 2Zn-insulin, 4Zn-insulin and monoclinic insulin crystals. These hexamers have been designated respectively 'T<sub>6</sub>', 'T<sub>3</sub>/R<sub>3</sub>' and 'R<sub>6</sub>', as described in Fig. 1.

The finding that phenol binds and stabilizes helix at B1-B8 in the insulin hexamer is a reminder of how complex interactions between ligands and proteins can be. It also raises the question of how the Zn-insulin hexamers stored in the  $\beta$ -cell are constructed: the high concentrations of peptides, Ca<sup>2+</sup>, Zn<sup>2+</sup> and counterions could all influence the conformation at B1-B8. Moreover, the switch from extended sheet to helix is reminiscent of structural transitions observed in signalling and allosteric mechanisms, often associated with Zn<sup>2+</sup> or Ca<sup>2+</sup> (ref. 14).

The similarity between phenol and tyrosine raises the possibility that a tyrosyl side-chain from the insulin receptor stabilizes the B-chain N-terminal helix in the course of generating a signal

TABLE 1 Crystallographic and structural data

Hexamer type	Space group	No. molecules per asymmetric unit	Cell parameters	$R_{\text{cryst}}^*$	Resolution	Approximate point symmetry in hexamer	No. Zn sites	Chemical species associated with Zn	Limits of B-helix	
2Zn-insulin (T <sub>6</sub> )	R3	2	$a_h = 82.5$ , $b_h = 82.5$ , $c_h = 34.0$ , $\gamma = 120^\circ$	0.154	1.5 Å	32	2	H <sub>2</sub> O	B9-B20	M1‡
4Zn-insulin (T <sub>3</sub> /R <sub>3</sub> )	R3	2	$a_h = 80.7$ , $b_h = 80.7$ , $c_h = 37.6$ , $\gamma = 120^\circ$	0.18	1.5 Å	3	5	Cl, H <sub>2</sub> O	B9-B20	M2
2Zn-insulin phenol (R <sub>6</sub> )	P2 <sub>1</sub>	6	$a = 61.36$ , $b = 61.71$ , $c = 47.95$ , $\beta = 110.8$	0.22	1.8 Å†	32	2	Cl, H <sub>2</sub> O	B1-B20	M1
									B1-B20	M2
									B1-B20	M3
									B1-B20	M4
									B1-B20	M5
									B1-B20	M6

\*  $R_{\text{cryst}} = \sum ||F_o| - |F_c|| / \sum |F_o|$  where  $|F_o|$  and  $|F_c|$  are the observed and calculated structure amplitudes respectively (all data included).

† Diffraction data collected on a diffractometer extend to 2.5 Å (15,785 reflections); data collected with synchrotron radiation extend to 1.8 Å (30,841 reflections). The molecular replacement and initial refinement calculations were carried out on the diffractometer data. Refinement of the atomic positions and thermal parameters were carried out on a combined diffractometer and synchrotron radiation data set ( $R_{\text{merge}} = 0.06$ ). The usual Fourier and fast Fourier least squares minimization methods were used in which the calculated shifts were restrained by the requirements of peptide geometry<sup>12,13</sup>. All 2,430 protein atoms in the asymmetric unit have been located and refined; the six phenol molecules and 421 water molecules have also been identified and included in the refinement calculations. The  $R_{\text{cryst}}$  on all data is 0.22. The r.m.s. deviation from ideal bond lengths is 0.03 Å; accuracy of the well defined atomic positions is estimated to be about 0.2 Å. The atomic parameters will be deposited in the Brookhaven Data Bank.

‡ M1-M6 represent the insulin molecules in the asymmetric unit.

FIG. 1 Arrangement of the three monomers around the upper (a) and lower (b) Zn ions, and the complete hexamer structures (c) in the 2Zn- and 4Zn-insulin crystals and the 2Zn-insulin (phenol) crystals. C $\alpha$  positions are shown together with B5 and B10 histidyl side chains involved in Zn coordination. The A-chain is drawn with open bonds, the B-chain B9-B30 is drawn as a single line and the B-chain residues B1-B8 are drawn in heavy lines. The phenol molecules and the off-axial Zn sites in 4Zn-insulin are also shown. The stoichiometry of Zn in 4Zn-insulin is not well defined: when the off-axial sites are fully occupied in molecule 2 (b), there are 4Zn ions per hexamer, but two populations, with alternative B10 His conformations also occur. One of these has Zn bound on the axial site (to B10 His); the other has Zn bound at the off-axial site (B5 His and B10 His). The conformation that does not bind phenol is analogous to an allosteric T state; the extended conformation at B1-B8 is thus called T. By the same analogy, R represents the structure with helix at B1-B8 that binds phenol.

FIG. 2 The electron density of one of the phenol molecules. The OH group is hydrogen-bonded to the carbonyl oxygen and amide nitrogen of the A6 and A11 cysteines respectively, linked in a disulphide bond. The phenol makes van der Waal's contacts with the dimer-dimer interface (Fig. 1). The imidazole B5 group makes a roughly perpendicular approach of 3.4 Å to the phenol molecule. It belongs to an insulin molecule from one dimer; the A-chain residues surrounding the other surfaces of the phenol are from the insulin molecule in the adjacent dimer. Other contacts are not shown.

after hormone binding. Independent studies have shown that phenol binding greatly reduces exchange with solution by the  $\text{Zn}^{2+}$  ions trapped by the B1-B8 helix extension (A. Wollmer and M. Dunn, personal communication). Several commonly used insulin preparations use phenol or similar molecules as a preservative<sup>15</sup>. The protamine (NPH) insulin, for example, contains phenol or cresol at concentrations (0.1–0.25%) high enough to induce the helix structure at B1-B8 observed in the monoclinic insulin crystals. Indeed, the 'R<sub>6</sub>' hexamer with six bound *m*-cresol molecules has been recently identified in NPH insulin crystals, helping to explain their extra stability (F. Korber, personal communication). It is conceivable that other phenol-like molecules could also be used to enhance the stability of the hexamer in solution, leading to a range of insulin preparations of increased stability. □

**NANOMETRE-SCALE semiconductor quantum crystallites exhibit size-dependent and discrete excited electronic states which occur at energies higher than the band gap of the corresponding bulk solid<sup>1–4</sup>. These crystallites are too small to have continuous energy bands, even though a bulk crystal structure is present. The onset of such quantum properties sets a fundamental limit to device miniaturization in microelectronics<sup>5</sup>. Structures with either one, two or all three dimensions on the nanometer scale are of particular interest in solid state physics<sup>6</sup>. We report here our discovery of the biosynthesis of quantum crystallites in yeasts *Candida glabrata* and *Schizosaccharomyces pombe*, cultured in the presence of cadmium salts. Short chelating peptides of general structure ( $\gamma$ -Glu-Cys)<sub>n</sub>-Gly control the nucleation and growth of CdS crystallites to peptide-capped intracellular particles of diameter 20 Å. These quantum CdS crystallites are more monodisperse than CdS particles synthesized chemically. X-ray data indicate that, at this small size, the CdS structure differs from that of bulk CdS and tends towards a six-coordinate rock-salt structure.**

*C. glabrata* and *S. pombe* respond to Cd salts by synthesizing  $\gamma$ -glutamyl peptides<sup>7,8</sup>. Cytoplasmic cadmium ions are sequestered within complexes containing these  $\gamma$ -Glu peptides<sup>7,9</sup>. Related metal- $\gamma$ -peptide complexes are found in metal-exposed plants and *Euglena gracilis*<sup>10–12</sup>. The metal-peptide complexes readily incorporate sulphide ions arising from a Cd-mediated enhancement of cellular sulphide generation<sup>13–15</sup>. Typical isolates of such cytoplasmic metal-thiolate-peptide complexes can be resolved by gel filtration into clusters varying in sulphide content<sup>14</sup>. The Stokes' radius of the metal-thiolate-peptide complex increases in direct proportion to the sulphide/cadmium ratio. Thus, complex size seems to be dictated by the magnitude of the metal-induced sulphide response.

Transmission electron microscopy (TEM) of the Cd- $\gamma$ -Glu peptide complex (S/Cd=0.7) from *C. glabrata* shows dense aggregates of particles, each having diameters of  $20 \pm 3$  Å and a Stokes' radius of  $\sim 16$  Å. Similar complexes from *S. pombe* (S/Cd=0.6) are  $\sim 18$  Å in diameter. In both cases, the powder X-ray pattern of lyophilized material shows one sharp low-angle peak (Fig. 1), indicating a dense aggregate of near monodisperse, spherical, homogeneous particles. The particle diameters obtained by X-ray diffraction are consistent with those from the electron microscope.

The Bragg diffraction patterns show clear differences between the biogenic crystallites and the bulk solid. The Cd-S bond is on average shorter in the crystallite by about 3–6%. The diffraction pattern from the *S. pombe* complex is accounted for best by the six-coordinate rock-salt structure; a structure previously reported for CdS only at high pressure<sup>16</sup>. The *C. glabrata* complex gives rise to a diffraction pattern consistent with a structure which is intermediate between rock-salt and the naturally occurring zinc-blende four-coordinate structure. Both show an 8 Å coherence length, corresponding to a short network of about four identical Cd-S bonds; surface-bonding changes may contribute to such short lengths in small particles. TEM internal lattice images are not on average observed because of this short

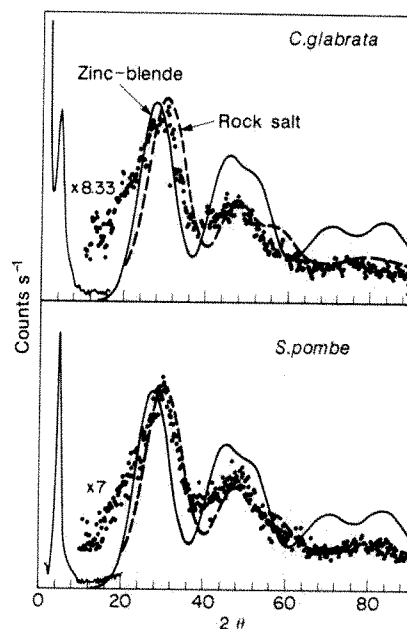

FIG. 1 1.54 Å powder X-ray patterns of desalted lyophilized Cd- $\gamma$ -Glu peptide complexes from *C. glabrata* (top) and *S. pombe* (bottom). The samples were purified by a combination of ion-exchange and gel-filtration chromatography as described previously<sup>9,15</sup>. The samples were desalted by chromatography on Sephadex G-25 equilibrated and eluted with deionized water. Desalted samples were dried in X-ray tubes under vacuum. Solid and dashed lines, expected patterns for zinc-blende and rock-salt lattices, respectively, with an 8 Å coherence length. The sharp peak at low angle ( $4^\circ$ ) represents particle spacing in the dense isolate. The nearest-neighbour distances are 22 Å and 20 Å for isolates from *C. glabrata* and *S. pombe* respectively.

coherence length. The  $\gamma$ -glutamyl peptide coating of the *C. glabrata* 20-Å crystallites consists of approximately 30 peptides of predominantly  $n_2$  and  $n_2$  desGly. The cysteinyl thiolates in the peptides are surface ligands to the core of  $\sim 85$  CdS units.

Both yeasts also produce larger, extracellular CdS particles of uncharacterized coating, whose high apparent molecular weight is indicated by sedimentation at 40,000g and elution in the excluded volume on Sepharose 6B. Particles of diameter  $29 \pm 5$  Å, some of which show zinc-blende internal lattice images (Fig. 2), are shown by electron microscopy. The X-ray Bragg pattern also reveals a zinc-blende structure with an 8 Å coherence length.

The optical band gap of synthetic CdS quantum crystallites increases with decreasing diameter, in agreement with theory<sup>17</sup>. Similarly, the lowest excited state of the 20 Å intracellular particles occurs between 300 and 315 nm (Fig. 3), almost 1.5 eV above the bulk band gap. Smaller sulphide-deficient complexes in *S. pombe* have transitions shifted to higher energy. This spectral shift<sup>14</sup> reflects the size variation of the CdS core. Significantly, extracellular zinc-blende CdS particles of diameter  $\sim 29$  Å have a 365 nm transition (Fig. 3) which is similar to that of synthetic CdS crystallites of comparable diameter (Fig. 3, inset).

Approaches to synthesizing quantum crystallite colloids of CdS have used microstructured environments and/or polymeric surfactants to prevent irreversible precipitation of bulk solid<sup>18-23</sup>. Quantum crystallites previously isolated and purified, have been capped with small organic groups<sup>24</sup>, or with polymeric sodium hexametaphosphate<sup>20</sup>. Only zinc-blende structures have been reported. The narrow, low-angle X-ray peaks (Fig. 1), and the narrow optical transition in the *C. glabrata* particle, imply that these biogenic, short-peptide-capped CdS crystallites are more monodisperse than typical synthetic particles.

Preliminary experiments *in vitro* indicate that these peptides are effective in terminating the growth of crystallites of a specific size. The intracellular crystallites exhibit properties common to small synthetic semiconductor particles such as luminescence at  $\sim 460$  nm and photo-induced electron transfer to methyl viologen. At physiological pH the peptide-coated particles are stable; at pH 3.5, accretion and growth readily occur.

We report here the first demonstration of the biological synthesis of quantum semiconductor crystallites of CdS. Because

FIG. 2 High-resolution, axial bright-field transmission electron micrograph taken near the Scherzer focus of the *S. pombe* extracellular CdS particle. The sample was dissolved in an aqueous ionic surfactant solution and dried on a thin carbon substrate. Some crystallites show faint images of internal lattice structure when a (111) axis lies in the substrate plane.

FIG. 3 Optical absorption spectra of the CdS complexes. The samples include peptide-bound CdS particles from *C. glabrata* (—), *S. pombe* (---) and the extracellular CdS particle from *S. pombe* (-·-·-). The samples contain 4, 8 and 20  $\mu\text{g}$  Cd<sup>2+</sup> per ml, respectively. The extracellular CdS complex was isolated by sedimentation at 40,000g and followed by washings. The precipitate was resuspended in 20 mM potassium phosphate, pH 6.5, and concentrated by ultrafiltration (Amicon PM30) followed by filtration (0.2  $\mu\text{m}$  filter). The 0.2  $\mu\text{m}$  filtrate was precipitated with 30 mM Mg<sup>2+</sup> and the final precipitate was resuspended in water and analysed. The (—) line represents the absorption spectrum of *C. glabrata* CdS peptide complex acidified to pH 1.5 to remove H<sub>2</sub>S and re-neutralized to pH 7. The inset is the optical absorption spectra of a chemically prepared 30-Å-diameter zinc-blende CdS crystallite described previously<sup>4</sup>.

the dissociation constant of crystalline CdS is extremely small, bioformation of solid CdS sequesters and thus detoxifies intracellular Cd ions. Electron-dense CdS granules have also been observed on the cell surface of the bacterium *Klebsiella aerogenes*<sup>25</sup>.

Quantum, metal sulphide crystallites have optical absorption, photosynthetic and electron transfer properties that are size-tunable<sup>1,3</sup>. The peptides used by these yeasts occur quite commonly in nature. It is conceivable that in some organisms metal sulphide crystallites have a physiological role other than detoxification. □

Please follow these guidelines so that your manuscript may be handled expeditiously.

*Nature* is an international journal covering all the sciences. Contributors should therefore bear in mind those readers for whom English is a second language and those who work in other fields. Please write clearly and simply, avoiding unnecessary technical terminology. *Nature's* staff will edit manuscripts to those ends if necessary. Contributors should check their proofs carefully.

Because of the competition for space, many of the papers submitted for publication cannot be accepted. For this reason, and because brevity is a great assistance to readers, papers should be as brief as is consistent with intelligibility. Please note that one printed page of *Nature*, without diagrams or other interruptions of the text, has fewer than 1,300 words.

## CATEGORIES OF PAPER

**Review Articles** survey recent developments in a field. Most are commissioned, but suggestions are welcome in the form of a one-page synopsis addressed to the Reviews Coordinator. Length is negotiable in advance but must not exceed six pages of *Nature*.

**Articles** are research reports whose conclusions are of general interest and which are sufficiently rounded to be a substantial advance in understanding. They should not have more than 3,000 words of text or more than six display items (figures and tables) and should not occupy more than five pages of *Nature*.

Articles should be accompanied by a heading of 50–80 words written to advertise their contents in general terms, to which editors will pay particular attention. A heading (printed in italic type) is not an abstract and should not usually contain numbers or measurements. The study should be introduced in more detail in the first two or three paragraphs, which should also briefly summarize its results and implications.

Articles may contain a few subheadings of two or three words. The meaning of the text should not depend on the subheadings, whose function is to break up the text and to point to what follows. There should be fewer than 50 references.

**Letters to Nature** are short reports of outstanding novel findings whose implications are general and important enough to be of interest to those outside the field. Letters should not have more than 1,000 words of text or more than four display items and should not occupy more than two pages of *Nature*. The first paragraph should describe, in not more than 150 words, the origins and chief conclusions of the study. Letters should not have subheadings or more than 30 references.

**Commentary** articles deal with issues in, or arising from, research that are also of interest to readers outside research. Some are commissioned, most are unsolicited. They are normally between one and four pages of *Nature* in length.

**News and Views** articles are intended to inform non-specialist readers about a recently published advance. Suggestions should be made to the News and Views Editor. Illustrations are welcome. Proposals for meeting reports should be agreed in advance.

**Scientific Correspondence** is for the discussion of scientific matters, including contributions published in *Nature*. Priority is given to contributions of less than 500 words and five references. Figures are welcome.

**Submission.** All manuscripts may be submitted to either London or Washington. They should not be addressed to editors by name. Manuscripts or proofs sent by air courier to London should be declared as 'manuscripts' and 'value \$5' to prevent the imposition of import duty and value-added tax (VAT).

## GENERAL

All contributions submitted for publication in *Nature* should conform with these rules.

**Manuscripts** should be typed, double-spaced, with a good-quality printer, on one side of the paper only. Four copies are required, each accompanied by lettered artwork. Four copies of half-tones should be included. Reference lists, figure legends and so on should be on separate sheets, all of which should be double-spaced and numbered. Copies of relevant manuscripts in press or submitted for publication elsewhere should be included, clearly marked as such. Revised and resubmitted manuscripts should also be clearly marked as such and labelled with their reference numbers.

**Titles** should say what the paper is about with the minimum of technical terminology and in fewer than 80 characters. Authors should avoid active verbs, numerical values, abbreviations and punctuation and should include one or two key words for indexing purposes.

**Artwork** should be marked individually and clearly with the author's name, figure number and, when known, manuscript reference number. Original artwork should be unlettered. Ideally, no figure should be larger than 28 by 22 cm. Figures with several parts are permitted only if the parts are closely related, either experimentally or logically. Suggestions for cover illustrations, with captions, are welcome. Original artwork (and one copy of the manuscript) will be returned when a manuscript cannot be published.

**Colour Artwork.** A charge of £500 a page is made for 4-colour figures. Inability to meet these costs will not prevent the publication of essential colour figures if the circumstances are explained.

**Figure legends** must not exceed 300 words and ideally should be much shorter, and should use telegraphic form wherever possible. The figure should be described first, then, briefly, the method. Reference to a method described elsewhere is preferable to a full description. Methods should not be described in detail in the text.

**References** should be numbered sequentially as they appear in the text, followed by those in tables and finally those in the figure legends. Reference numbers apply only to papers published or in the press, and a different number should be given to each paper cited. All other forms of reference (including unrefereed abstracts) should be included in the text as personal communication, manuscript in preparation or preprint (with number and institution where appropriate). Text should not be included in the reference list. References should be abbreviated according to the *World List of Scientific Periodicals* (fourth edition, Butterworth, London, 1963–65). The first and last page numbers should be cited. Reference to books should clearly indicate the publisher and the date and place of publication.

**Abbreviations,** symbols, units and Greek letters should be identified the first time they are used. Acronyms should be avoided as much as possible and, when used, defined. Editors will shorten words if necessary. In case of doubt, SI units should be used.

**Footnotes** should not be used except for changed addresses or to identify the corresponding author if different from the first-named.

**Acknowledgements** should be brief. Grant numbers and contribution numbers are not allowed.

## Reviews on IMMUNOASSAY TECHNOLOGY

*Edited by S. B. Pal*

Immunoassay techniques are continually being developed and refined, and applied in a broader range of uses. The books in this series comprise review articles and descriptions of methods of immunoassay, which are not reliant on radioisotopes, and reflect the growing importance of immunoassay technologies.

## We Launched two Monoclonal Antibodies

### Monosan monoclonal antibody against MDR Related P-glycoprotein (JSB-I) cat.no. MON 9011

This newly generated monoclonal antibody **MONOSAN<sup>®</sup>** (MDR) JSB-I recognizes a strongly conserved epitope of P-glycoprotein present on both human and animal multi drug-resistant tumor cells. The antibody has been selected for optimal performance in immunocytological and immunohistological staining techniques. **MDR/JSB-I** reacts to air-dried or acetone-fixed cytopins and cryostat tissue sections. **MDR/JSB-I** staining of cyto-/histological tumor specimens may contribute to customizing individual cancer therapies by predicting cytostatic drug (un-) responsiveness.

**Pan-Epithelial  
marker of formalin  
fixed and frozen  
tissue monoclonal  
antibody**

### **ANTI-DESMOSOME** (clone 32-2B)

This monoclonal antibody has extensively been characterized and offers considerable potential as immunohistochemical tool for distinguishing epithelial cells (carcinomas) from other cell types. The antibody specifically reacts with desmosomes, the adhesive intercellular junctions, which occur in epithelia. The present antibody is directed against an epitope of desmosomal glycoprotein 1, which is essentially preserved in both normal and malignant epithelial cells in routinely processed paraffin sections. The antibody is particularly useful for distinguishing anaplastic carcinomas from malignant lymphomas.

## QUIXELL 42

## CELL TRANSFER SYSTEM

**QUIXELL 42** is a revolutionary new system for the rapid collection and transfer of individual cells, clones and other organisms from one vessel to another. The unique positive displacement micro pipette makes possible the controlled collection of a cell while remaining under full observation. A single collect/transfer operation takes only seconds allowing a microtiter tray to be rapidly seeded with individual cells. A wide range of pipette diameters are available to suit multiple applications.

The joystick control is used to guide a cell towards the tip of the pipette,

the cell is drawn into the pipette,

and a single keypress transfers the cell to a well in the microtiter tray. The system is now ready to collect the next cell.

# Chemiluminescence lights up

I. Bronstein and P. McGrath

Chemiluminescent substrates for alkaline phosphatase and  $\beta$ -galactosidase are now available for use in immunoassays and DNA hybridization assays.

ONE of the most fascinating displays of energy release is the phenomenon of luminescence. In the broadest sense, luminescence is the conversion of energy into light. The energy required for the emission of light is generated by the oxidation of a specific substrate. Biological luminescence, or bioluminescence, occurs in organisms such as bacteria, fungi and insects<sup>1</sup>. The firefly *Photinus pyralis*, the most familiar example of bioluminescence, generates an incredibly efficient 88 per cent of its energy as luminescence. The mechanism of this reaction involves the adenylation of firefly luciferin by ATP in the presence of the enzyme firefly luciferase. Luciferin adenylate is then oxidized to a peroxide which ultimately decomposes to oxyluciferin, AMP, and  $\text{CO}_2$ , accompanied by light emission<sup>2</sup>.

The use of firefly bioluminescence in immunoassays has been demonstrated<sup>3</sup>, but the complexity and instability of the system makes this application impractical. The high background signal arising from ATP contamination further reduces the commercial potential of luciferase, because most bioluminescent assays are based on ATP detection<sup>4</sup>. Several attempts to conjugate the luciferase enzyme to antibodies have failed because of the instability of the constructs; the only successful example of labelling an anti-human antibody with bacterial luciferase is used in a rubella antibody assay<sup>5</sup>. Recently, the gene for luciferase has been cloned<sup>6</sup>, and recombinant firefly luciferase is now on the market.

## Chemiluminescent glow

Highly sensitive photomultipliers have been used to show that chemical luminescence, or chemiluminescence, is a universal property of organic substances able to undergo an oxidative reaction sufficiently exothermic to produce an emitting state. (Lightning is an example of chemiluminescence in the gases of the earth's atmosphere.) But initial expectations that chemiluminescence could be adapted readily for use in clinical diagnostics have turned to scepticism. The luminol 5-amino-2,3-dihydrophthalazine-1,4-dione, for example, when utilized as an antibody label allows only subnanomolar detection after activation with hydrogen peroxide, alkali and microperoxidase<sup>7</sup>. Peroxyoxalate chemiluminescence — generated from the reaction of oxalyl chloride, hydrogen peroxide and a

FIG. 1 Adamantyl-1,2-dioxetane phosphate (AMPPD), substrate for alkaline phosphatase, and its mechanism of chemiluminescent decomposition.

fluorescent compound such as anthracene or fluorescein<sup>8</sup> — shows very high efficiency in organic solvents, but in aqueous environments its quantum yield is considerably reduced<sup>9</sup>. The chemiluminescent signal obtained from these systems is also in the form of a short-lived (microsecond to millisecond) "flash" which requires expensive, highly sensitive photomultipliers for recording in real time.

Despite its difficulties, luminescence offers several advantages over other analytical labelling techniques: high sensitivity, low background, a wide linear range, low cost per test, and no radiation hazards. Systems which provide a chemiluminescent "glow" signal rather than a "flash" also can be detected with simple and inexpensive instruments, such as photodiode-based luminometers, and X-ray and instant photographic films.

Some luminescent labels used in bioassays can be quantified rapidly, and are relatively stable. To date, commercial chemiluminescent systems include acridium esters and enhanced luminols. (*N*-methylacridinium salts react efficiently with aqueous alkaline hydrogen peroxide to yield the excited state of *N*-methylacridone, which luminesces with a 4 per cent quantum yield<sup>10</sup>.) The basic chemiluminescent reaction mechanism is well understood, and esters which are stable for up to one year in solution have been synthesized<sup>11</sup>. The mechanism of enhanced chemiluminescent reactions is complex, and is based on the enzyme horseradish peroxidase, which catalyses the chemiluminescent oxidation of cyclic diacylhydrazines such as luminol. Luminol is oxidized by complexes formed between oxidants (hydrogen peroxide and alkali) and horseradish peroxidase, to form luminol radicals which decompose through an endoperoxide intermediate to form the excited state 3-aminophthalate dianion. When the excited state decays into its ground state, it emits light. The reaction can be improved significantly by the presence of certain phenol, naphtol, and amine "enhancers"<sup>12</sup>.

Chemiluminescent systems such as acridium esters and luminols require hydrogen peroxide, alkali, and other reagents to generate the emitting state. The addition of these chemiluminescence-stimulating reagents generally leads to a "burst" or "flash" of light, which is difficult to record by ordinary photomultiplier tube-based instruments, leading to imprecise test results.

## Flashy chemistry

Tropix has designed and synthesized a proprietary new dioxetane-based direct chemiluminescent substrate, adamantyl-1,2-dioxetane phosphate (AMPPD), for alkaline phosphatase<sup>13</sup> (Fig. 1). The AMPPD molecule is stable, emits energy at the wavelength of visible light, and has a built-in energy source (its peroxy bond). The Tropix "intelligent" molecule also

FIG. 2 a, Chemiluminescent (AMPPD) and b, colorimetric (BCIP/NBT) detection of HBV<sub>c</sub> DNA in a hybridization assay, using Polaroid Instant Black and White Type 612 film.

contains a "keyhole", specific for the alkaline phosphatase enzyme "key", which is used to unlock the stored energy of the molecule and trigger light emission. Tropix has also engineered a molecule which is activated by  $\beta$ -galactosidase.

Upon reaction with alkaline phosphatase, the AMPPD substrate spontaneously chemiluminesces. Unlike acridium esters and other common chemiluminescent systems, AMPPD is already in an oxygenated state, capable of releasing up to 100 kcal mol<sup>-1</sup> of energy. Alkaline phosphatase dephosphorylates AMPPD to form a dioxetane anion, which fragments into adamantane and the excited state of methyl *meta*-oxybenzoate anion, the light emitter<sup>14</sup>.

The activation energy for AMPPD decomposition in hydrogen peroxide is 21.5 kcal mol<sup>-1</sup>, as determined from Arrhenius plots. The measured decomposition parameters include both the thermal component, or the breakdown of the oxygen-oxygen bond, and the non-enzymatic hydrolysis of the protective group. In spite of its low activation energy, AMPPD is remarkably stable: the half-life of AMPPD in water is 142 hours at 30 °C, and in the presence of carbonate buffer at pH 12, it increases to 6,214 hours. AMPPD exhibits an indefinite shelf-life in the solid form at 4 °C. Because the nonenzymatic decomposition of AMPPD produces fragments which do not exhibit chemiluminescence, even in the presence of enzyme, there is no background signal<sup>14</sup>. Moreover, alkaline phosphatase-catalysed chemiluminescence from AMPPD is constant for prolonged periods of time. Using AMPPD, 0.001 attomole of alkaline phosphatase has been detected, on both immobilized membrane supports and in solution<sup>14</sup>. Comparable results have been obtained measuring the luminescent signal using a luminometer or Polaroid Type 612 film.

A comparison of the sensitivities of AMPPD and the chromogenic substrate 5-bromo-4-chloro-3-indolylphosphate/nitro blue tetrazolium salt monohydrate (BCIP/NBT) in detecting alkaline phosphatase has been made in a DNA probe hybridization assay for hepatitis B virus core antigen (HBV) DNA (Fig. 2). The sensitivity of the assay was improved by more than two orders of magnitude using the AMPPD substrate for the alkaline phosphatase label. The use of AMPPD also reduced the time required to obtain a result from roughly 240 minutes to 30 minutes<sup>15</sup>.

AMPPD offers an alternative to colourimetric and fluorescent substrates for alkaline phosphatase. The substrate has been used in a broad range of assays, including direct assays for enzymes; immunoassays for proteins, haptens and microorganisms; and DNA probe assays<sup>16</sup>. AMPPD's strong signal and low back-

# Today's immunology

A fusion protein combining the best of  $\beta$ -galactosidase with Protein G, a host of human cytokines and lymphokines, and a thermally regulated microplate reader are among this week's offerings for the immunologist.

PROTOS Laboratories is now selling a line of **peroxidase-conjugated Fab' fragments** of affinity-purified antibodies (*Reader Service No. 101*). Enzyme-labelled antibodies are being used increasingly for the localization of cellular antigens in tissue sections using light or electron microscopy. To address the demand, Protos Labs has developed goat Fab' fragments linked to peroxidase which are specific for human IgG, IgA, IgM, kappa chain and lambda chain. For use in indirect staining techniques, Protos Labs offers goat Fab' anti-mouse and anti-rabbit IgG (heavy

The Protos peroxidase-Fab' fragment hybrid.

and light chains), adsorbed to insolubilized human serum. Protos Labs says its 87,000 MW Fab' conjugates penetrate tissue readily and exhibit low background staining. The Fab' conjugates cost \$80-85 (US) for 1 ml.

The **anti-phosphotyrosine fluorescein-conjugated** monoclonal antibody from Boehringer Mannheim Biochemicals is tested for its ability to stain tyrosine-phosphorylated protein in PHA-activated lymphocytes (*Reader Service No. 102*). The fluorescein conjugate supplements the company's monoclonal antibody to phosphotyrosine, which detects phos-

Boehringer Mannheim's MAB's against phosphotyrosine.

phorylated tyrosine residues produced by protein kinase activities. Boehringer Mannheim says the antibody is suited for purifying and characterizing phosphotyrosyl-growth factor receptors, transforming proteins and their substrates, and that it does not cross-react with any phosphorylated amino acids, ribose phosphate or nucleotides. The antibody can also be used for Western blot analysis, immunocytochemistry and flow cytometry.

ICN Biochemicals is offering **synthetic Lipid A** for research purposes (*Reader Service No. 103*). The company says its synthetic product has identical biological and endotoxic activities in test systems for lethal toxicity, pyrogenicity, local Shwartzman activity, Limulus Amoebocyte Lysate gelation capacity, B cell mitogenicity, induction of prostaglandin synthesis in macrophages, tumour necrotizing activity and specificity of antigenic determinants as natural Lipid A. The synthetic Lipid A is available as a lyophilized powder, with no excipient added, and costs \$85 (US) for 0.1 mg.

ground means it can be used with a variety of photosensitive detection devices, such as photomultiplier tubes, photodiodes, and photographic and X-ray films<sup>17</sup>. The utility of AMPPD in electrophoresis, blotting, sequencing, chromatography, and cytometry<sup>18</sup> is now being tested. □

Irena Bronstein and Patricia McGrath are at Tropix, Inc., 47 Wiggins Avenue, Bedford, Massachusetts 01730, USA. For more information, fill in reader service number 100.

BRL says its **goat anti-rat IgG (H + L) antibody** and conjugates are useful for probing mouse tissues, cells or extracts with rat primary antibodies (*Reader Service No. 104*). The product is immunoadsorbed against mouse serum to remove cross-reactivity to mouse immunoglobulins. The secondary antibodies react specifically with rat primary antibodies, and are affinity-purified using rat IgG. They are available unconjugated or conjugated to horseradish peroxidase, alkaline phosphatase or fluorescein isothiocyanate.

### Cytokines and lymphokines

A variety of human and murine blood cell-related substances, **lymphokines and cytokines** are now available from Bachem Bioscience, Inc. (*Reader Service No. 105*). The company carries a full line of interleukins, interferons and colony-stimulating factors which are cloned, expressed, purified and tested for activity in Bachem's own molecular biology laboratories. The current list includes human interleukin-1 beta, human interleukin-2, murine interleukin-3, human interferon-gamma, and human and murine GM-CSF.

R&D Systems, Inc. sells **recombinant human cytokines** expressed, purified and assayed in the laboratories of the company from British Bio-technology's Designer Genes line of human genes (*Reader Service No. 106*). R&D Systems's range of growth factors isolated from natural sources includes bovine fibroblast growth factor alpha, bovine fibroblast growth factor beta, human and porcine tissue growth factor betas, and human and porcine platelet-derived growth factors. The company also has a line of exon-specific, anti-sense DNA probes for human interleukins, and an array of neutralizing antibodies for cytokines.

### Sorting and typing

Dynal UK Ltd has a set of **immuno-magnetic polystyrene beads** for separating and quantifying subsets of human T-lymphocyte CD4 (helper-inducer) T cells, CD8 (cytotoxic-suppressor) T cells and CD2 (Pan) T cells (*Reader Service No. 107*). The M-450 Dynabeads are uniform magnetizable polystyrene beads which bind positively to the target cells when coated with specific monoclonal antibodies. Rosettes of magnetic beads form around the T cells, allowing them to be isolated in a magnetic separation step which does not involve centrifugation. The isolated cells can be quantified or used for further studies, or the supernatant — depleted of target cells — can be analysed. Dynal says the beads do not affect cell viability, and yield preparations with better than 99 per cent purity.

The Immunobead reagents for **human B cell labelling** from Bio-Rad consist of

Bio-Rad's Immunobead B cell labels at work.

micron-sized hydrophilic particles with covalently bound highly-purified rabbit anti-human immunoglobulin (heavy and light chains) antibodies (*Reader Service No. 108*). The Immunobead reagents simultaneously label lymphocyte surface immunoglobulins and identify any contaminating monocytes by phagocytic ingestion, says Bio-Rad. B cells are rosetted and counted using either phase or transmission microscopy, eliminating the need for fluorescent microscopy. Bio-Rad says Immunobead reagents do not react with the Fc receptors present on certain lymphocytes, so only those cells with immunoglobulin present on their surfaces are labelled. The reagent can be used simultaneously with sheep erythrocytes to rosette human B and T cells. Immunobead reagents specific for the individual human immunoglobulins IgG, IgA or IgM are available for determining subpopulations.

**Magnetic cluster of differentiation (CD) antibodies** for the isolation of specific leukocyte populations are now available

CD antibodies add to the usefulness of BioMag.

from Advanced Magnetics, Inc. (*Reader Service No. 109*). Antibodies for CD3, CD4, CD6, CD8, CD9, CD10, CD16, CD19 and CD25 are available conjugated to Advanced Magnetics's BioMag particles, allowing for the purification, depletion, enrichment and quantification of specific leukocytes. The company says its BioMag particles are non-toxic and biodegradable, and that shear forces on the leukocytes are minimized by the small 1  $\mu$ m size of the particles.

### Protein G products

The InFerGene company recently launched ProFusion  $\beta$ -Gal/G, a product which incorporates into one protein the active immunoglobulin-Fc binding sites of Streptococcal Protein G and the enzyme activity of *Escherichia coli*  $\beta$ -galactosidase (*Reader Service No. 110*). ProFusion  $\beta$ -Gal/G is a fusion protein created by recombinant means, and InFerGene says the product has a greater batch-to-batch consistency and a higher specific activity than similar conjugates made by chemical coupling reactions. InFerGene is now selling ProFusion  $\beta$ -Gal/G directly, and through its American Enzyme Corporation subsidiary.

The GammaBind G HPLC columns from Genex are affinity columns packed with a pH-resistant, polymer-coated silica solid support bound to recombinant protein G (*Reader Service No. 111*). Genex has engineered the protein G in the GammaBind G columns to increase its

Reader Service No.14

natural resistance to proteolytic degradation. The company says the recombinant product binds specifically and only to all subtypes of IgG antibodies, with no cross reactivity with other serum proteins or IgM, IgE or IgA antibodies. The GammaBind G columns can be used for purifying or quantifying IgG antibodies in serum, ascites fluid, and hybridoma cell culture supernatants; measuring IgG levels for quality control and process monitoring; concentrating and purifying IgG monoclonal antibodies from tissue culture media; removing IgG from serum samples; and purifying mitogen-free antibodies for lymphocyte studies. The GammaBind G columns come in analytical and semi-preparative sizes, and column adaptors are available to fit them to most HPLC systems.

### Harvesting and diluting

Hamilton Company has introduced a new multi-probe head accessory for its Micro-

Hamilton's head for diluting/dispersing. lab 2200 **automated liquid handling station** (Reader Service No. 112). The multi-probe head utilizes up to three Microlab 941 dual-channel diluters/dispensers as well as the two internal diluter channels in the Microlab 2200. It allows spacing between probes to be varied from 9 mm up to 21 mm. Up to eight independent reagent transfers can be performed simultaneously, reducing sample preparation time, says Hamilton. The multi-probe

head can be used to add reagent to tubes or microplates by aspirating and dispensing liquid through probe needles; to add reagent from large reservoirs by pumping through the syringes and tubing; and to perform serial dilutions in microtitre plates.

Cambridge Technology, Inc. has a **sample harvester** which it says can punch, harvest and deposit samples directly into

Model 2000 PHD sample harvester from Cambridge Technology.

any type of scintillation vials (Reader Service No. 113). Cambridge Technology's model 2000 PHD sample harvester has a large-diameter collection area and the ability to handle large samples — a plus for receptor binding assays. The \$4,800 (US) model 2000 harvests 24 samples at a time onto 25 mm collection sites, and inserts them into standard test tubes, gamma counter tubes, minivials or 20-ml scintillation vials, depending on which sample tray is used. Several grades of pre-cut glass fibre filter strips are available to go with the sample harvester.

### Plate readers

Molecular Devices has a **thermally regulated microplate reader** which allows researchers to perform valid kinetic anal-

The THERMOmax from Molecular Devices.

yses at elevated temperatures (Reader Service No. 114). The THERMOmax from Molecular Devices controls temperature from 4 °C above ambient temperature to 42 °C, with a resolution of 0.1 °C and a temperature variation across the microplate of less than 0.5 °C, says the company. The microplate can be kept stationary for turbidimetric assays, such as clot formation assays for the detection of endotoxin, or clot dissolution assays for the detection of TPA. For assays where mixing is necessary, such as bacterial growth studies, the instrument's Automix function minimizes the settling of cells. The SOFTmax 2.0 IBM-compatible soft-

ware for the THERMOmax performs nonlinear kinetic analyses and computes time to reach  $V_{max}$ . The software also includes five standard curve algorithms and a set of displays and reports.

Millipore's new CytoFluor **fluorescent measurement system** is a computer-controlled scanning device for multiwell plates which can be used to quantify both

Less than one-minute measurements with Millipore's CytoFluor fluorescent measurement system.

soluble and cell-associated fluorescent signal, for applications in cytotoxicity testing, phenotyping, cell receptor labelling, and fluorescence-based enzyme assays (Reader Service No. 115). Millipore says the instrument reads fluorescent signal in less than one minute through standard tissue culture plastic or through membrane-based tissue culture devices. The CytoFluor system can accommodate 6-, 12-, 24- or 96-well plates, and allows multiple wavelength scanning. All operations are software-driven, and data is reported as either an EXCEL spreadsheet or a comma separated values (CSV) file for fast data analysis.

Dynatech says its MR 5000 **kinetic microplate reader** is capable of reading an entire microplate in 1.7 seconds (Reader Service No. 116). The MR 5000 has a built-

Dynatech's microplate reader for kinetic analyses.

in microprocessor capable of storing up to 50 different user-defined test protocols, and the data from 20 microplates. The integral software allows for data analysis on any of the stored data, as well as on a newly read plate. □

These notes are compiled by Carol Ezzell from information provided by the manufacturers. To obtain further details about these products, use the reader service card bound inside the journal. Prices quoted are sometimes nominal, and apply only within the country indicated.

## INSTITUTE OF VIROLOGY AND ENVIRONMENTAL MICROBIOLOGY (OXFORD)

### RESEARCH VACANCIES

## MICROBIAL GENETICS, MOLECULAR BIOLOGY AND MICROBIAL PLANT ECOLOGY

With the expansion of the remit of the NERC Institute of Virology to include environmental microbiology, and the change of the name to the INSTITUTE OF VIROLOGY AND ENVIRONMENTAL MICROBIOLOGY, a new program of research in environmental microbiology has been launched.

Three new staff appointments have been created, two at the post-doctoral, (HSO), level and one at the post-graduate, (SO), level. We are looking for highly motivated individuals, with experience in prokaryotic genetics and molecular biology who would be interested in developing a research career in this important area. Knowledge of microbial ecology would be an asset. The initial research objectives of the group include the quantification and study of the fate, transfer and persistence of genetically engineered bacteria and their DNA in the environment following release onto plant surfaces, thereby leading to an understanding of the potential risk and environmental impact.

Salary will be in the range of £8,574-£10,994 for Scientific Officer appointments and £10,026-£13,460 for Higher Scientific Officer appointments. Starting salary depends on experience and qualifications. Staff of the Council are not Civil Servants but their pay and conditions are similar to those on the Civil Service. There is a non-contributory pension scheme.

Application forms are available from the **Administration Officer, Institute of Virology and Environmental Microbiology, Mansfield Road, Oxford, OX1 3SR. Telephone: Oxford (0865) 512361.** Informal enquiries may be made to Dr Mark J Bailey, at the above address, for further details of the posts available.

*The Natural Environment Research Council is an equal opportunity employer.*

## FACULTY POSITION IN DEVELOPMENTAL AND MOLECULAR BIOLOGY

**Institute for Molecular Biology and Biotechnology  
McMaster University**

The newly-created Institute for Molecular Biology and Biotechnology seeks to build a group composed of independent, but interactive scientists interested in the molecular biology of development. One tenure-track position is currently available at the assistant professor level. Applications are invited from but not restricted to individuals with research interests in the regulation of gene expression, the role of oncoproteins in development, growth and differentiation factors, and gene targeting in embryonic stem cells. A PhD. or M.D. degree and postdoctoral experience is required. The start date is July 1, 1990, or as soon thereafter as possible. Salary will be commensurate with experience. This position is subject to final budgetary approval.

In accordance with Canadian Immigration requirements priority will be given to Canadian citizens and permanent residents of Canada.

Applicants should send a current curriculum vitae, a statement describing research accomplishments and future goals, and the names of three references by May 31, 1989 to:

**Dr. John A. Hassell  
Institute for Molecular Biology  
and Biotechnology  
McMaster University  
1280 Main Street West  
Hamilton, Ontario L8S 4K1, Canada**

(NW3582)A

## UNIVERSITY OF BERNE SWITZERLAND YEAST MOLECULAR GENETICS GROUP LEADER POSITION POSTDOCTORAL POSITION

Applications are invited for the position of leader of a small research group from persons with postdoctoral experience. It is expected that the appointee develops his independent research program in the molecular analysis of genetic recombination in yeasts. Collaboration with the existing group is welcomed. Teaching obligations are minimal, but allow the recruitment of Ph D students. Appointment to this university position is for three years initially, with possible extensions (Habilitation-stelle). The position opens on the beginning of 1990.

Applications are invited for a postdoctoral position available this summer for the study of genetic recombination in fission yeast. Persons with experience in DNA research and protein-DNA interactions are preferred. The position is funded by the Swiss National Science Foundation. Appointment will be for two years initially.

The current projects of the group are aimed at the study of DNA recombination mechanisms in fission yeast. The approaches include formal genetics, cloning and sequencing of genes, study of gene expression, in vitro mutagenesis and yeast transformation, identification of recombination intermediates and enzymes.

For further information and applications (curriculum vitae, names of references), please contact **Prof. J. Kohli, Institute of General Microbiology, University of Berne, Baltzer-Strasse 4, CH-3012 Bern, Switzerland** (Telephone: 031 65 46 54). (W6039)A

Applications are invited for the following posts 4 of which are under the New Academic Appointments Scheme.

## DEPARTMENT OF ANATOMY LECTURER (NAAS)

Qualified in any relevant field.  
(Ref 89/34)

## SCHOOL OF PURE AND APPLIED BIOLOGY LECTURER (NAAS)

Applied Insect Taxonomy and Tropical Pest Management.

## UNIVERSITY OF READING

### School of Animal & Microbial Sciences

(Department of Pure & Applied Zoology)

Applications are invited for a Lectureship from 1 September 1989 (under the New Academic Appointments Scheme) in the Department of Pure & Applied Zoology with special responsibility to teach and research in the area of insect physiology and molecular biology of insects, particularly in relation to crop protection and pest control. Consideration would also be given to applications from persons working in appropriate fields but with non-insect pests. This post would further strengthen both the Department's and School's considerable activities in insect physiology and pest control. Initial salary up to £12760 p.a. on the Lecturer Grade A scale (£9260-£14500 p.a. under review) plus USS benefits. Further particulars and application forms (2 copies) are available from the

**Personnel Office, University of Reading, Whiteknights, PO Box 217, Reading, RG6 2AH.** Please quote Ref. AC. 8922. Informal enquiries to the Head of Department, Dr. A.R. Jones.

Closing date 12 May 1989.

(8962)A

## FACULTY POSITION DEPARTMENT OF BIOCHEMISTRY

The Department of Biochemistry is looking for candidates for a full-time faculty position available from July 1st, 1989.

The department is responsible for two undergraduate programs (biochemistry and microbiology) and two graduate programs.

The department has two research groups: an oral ecology group (GREB) and a group on molecular genetics (CRGM). Research activities of the GREB include fundamental aspects of microbiology, biochemistry, immunology and molecular biology related to the pathogenic mechanisms of dental caries, periodontal diseases and oral candidosis. Members of the CRGM group have a common interest in the regulation of gene expression and gene evolution while studying a variety of biological systems.

Applicants must hold a Ph.D. degree in microbiology or biochemistry and have at least one year of postdoctoral experience. The candidates must have a proven skill in written and oral French or be willing to acquire it within a year. The successful candidate:

- i) should preferably have an experience in one of the following fields: protein engineering, host-parasite interaction, virology, immunogenetic or membrane biology,
- ii) will be part of either one (or both) of the departmental group, and
- iii) will participate in the regular teaching of the department.

Applicants should submit their curriculum vitae, a statement on how they will integrate themselves in the departmental research groups and arrange to have three letters of recommendation sent to: **Denis Mayrand, Chairman, Département de biochimie, Faculté des sciences et de génie, Université Laval, Québec, Canada, G1K 7P4, (Tél: (418) 656-3016, FAX: (418) 656-5902).**

Deadline for receipt of applications is June 15, 1989. In accordance with Canadian Immigration requirements, this advertisement is particularly directed to Canadian citizens and permanent residents. *An equal opportunity employer (M/F).* (NW3589)A

## POSTDOCTORAL POSITIONS

**Public Health Service,  
National Institutes of  
Health, Research Triangle  
Park, North Carolina**

Postdoctoral scientists are needed in the Laboratory of Molecular Genetics of the National Institute of Environmental Health Sciences to investigate mechanisms of DNA replication, recombination and repair in the yeast *Saccharomyces cerevisiae*. Ph.D. or equivalent required in biochemistry, molecular biology, biology, microbiology, genetics or a related discipline. Salary range \$20,000 to \$28,000 for entry-level candidates, commensurate with background.

For additional information, contact Dr. Akio Sugino at 919-541-7732. To apply, submit curriculum vitae, bibliography, statement of future research interests and three letters of reference by May 30, 1989 to:

**Bruce Wiggins (HNV1);  
NIEHS Personnel Office;  
P.O. Box 12233; Research  
Triangle Park, NC 27709.**

**An Equal Opportunity Employer**

(NW3586)A

## MEDICAL RESEARCH COUNCIL LABORATORIES

THE GAMBIA

**Molecular biologist, MRC  
Laboratories, Fajara**

Applications are invited from suitably qualified scientists, preferably at the post-doctoral level, for a post as a molecular biologist at the MRC Laboratories, The Gambia. The successful applicant will join a team studying the infectious diseases such as malaria, pneumonia, measles, and HIV infection which are prevalent in tropical developing countries. He or she will be expected to develop a molecular biology laboratory in which molecular biological techniques can be used in diagnosis and in study of the epidemiology of infection diseases. Previous experience with the PCR technique would be an advantage.

The duration of the contract that will be offered is flexible; this might include a period in an established European molecular biology laboratory. Salary, which will be on the MRC International scale, will be determined by previous qualifications and experience.

Applications should be submitted to **TREVOR FLINDALL**, MRC Head Office, 20 Park Crescent, London W1N 4AL UK from whom further details may be obtained. The closing date for this application is 12 May 1989.

(8960)A

**Sandoz is a leading pharmaceutical company with an active research commitment in the field of cardiovascular medicine. We are looking for a**

# CELL BIOLOGIST

to join a new group within our cardiovascular department. As part of an interactive team the work will involve a basic research effort using cellular and molecular biology to address the pathology and treatment of cardiovascular disease.

The successful candidate will be in charge of his/her own laboratory and will be responsible for the establishment, characterization and maintenance of primary cultures and cell lines. Experience with endothelial cells/hepatocytes, immunohistochemical and in situ hybridization techniques would be an advantage.

Candidates who have a PhD or MD with research or industrial experience are invited to send a curriculum vitae including a list of publications, references and a statement of research interests to:

**Sandoz Ltd., Personnel Department, Ref. 9103,  
attention Dr. R. Racine (061 24 24 66)  
CH-4002 Basle, Switzerland**

(W6041)A

## MAMMALIAN CELL CULTURE

### SENIOR RESEARCH SCIENTIST

Celltech is one of Europe's foremost biotechnology companies. We are among the leaders in the research and manufacture of protein-based drug products, and with our portfolio of successful candidate therapies, we are establishing a fully integrated biopharmaceutical capability.

We are now looking for an experienced life scientist to join our fermentation physiology team. Working on the development of mammalian cell lines and processes for the manufacture of therapeutic proteins, you will investigate factors affecting productivity and product quality, screen and select candidate cell-lines, and develop appropriate media and fermentation regimes. This will involve close collaboration with Celltech's scientists in other areas, such as molecular biology, fermentation scale-up and protein purification.

Aged between 25 and 35 and with a PhD in a biological science, your most likely current R & D role will be in academia or industry; your research experience up to and, ideally, beyond doctoral level should include knowledge of tissue/cell culture. You will have the creativity and self-confidence to work as part of a scientific team, with the potential to lead it; good communication skills, written and verbal, are essential.

A highly competitive salary will be supported by a comprehensive benefits package which includes a pension scheme, share save scheme and relocation assistance if appropriate.

Please write, with full details of your qualifications and experience to date, to Mrs Jane Smith, BSc C BIOL MI BIOL, at Celltech Limited, 216 Bath Road, Slough, Berkshire SL1 4EN. Please quote Ref: 271.

(9005)A

## DEPARTMENT OF PSYCHIATRY UNIVERSITY OF TORONTO

### Applications are invited for the position of ASSISTANT PROFESSOR

in the area of Molecular Neurogenetics as applied to psychiatric disorders. This position requires a Ph.D. or other doctoral degree and significant post-doctoral experience in molecular genetics, molecular neurobiology or an equivalent field. The successful candidate will be expected to work collaboratively with a multidisciplinary neuroscience/neuropsychiatric research group comprised of basic and clinical researchers investigating the neurobiology and neurogenetics of psychiatric disorders. The position requires demonstrated ability to conduct independent research within a collaborative group and to compete for extramural funding.

The position is tenure track equivalent supported initially by the I'Anson fund. Salary is commensurate with rank and experience. The position also includes a one time start up research grant.

The University encourages both men and women to apply for positions. In accordance with Canadian immigration requirements, this advertisement is directed to Canadian citizens and permanent residents of Canada.

Candidates should submit a letter of application, a curriculum vitae and the names of three referees from whom letters of recommendation may be solicited. Please submit responses to: **Dr. Jerry I. Warsh, Director of Research, Clarke Institute of Psychiatry, 250 College Street, Toronto, Ontario M5T 1R8.**

The successful candidate would be expected to take up the appointment prior to September 1, 1989.

**Closing date for applications is May 19, 1989. (NW3559)A**

## GLAXO INSTITUTE FOR MOLECULAR BIOLOGY S.A.

The Geneva biotechnology research unit of the largest U.K. pharmaceutical group has a vacancy for a

# Biochemist

to investigate  
**membrane receptors**  
**signal transduction mechanisms**

The Glaxo Institute for Molecular Biology applies a molecular approach to the discovery of effective new medicines. Projects include inflammatory diseases, viral therapeutics, neurobiochemistry and the regulation of cell proliferation and differentiation.

The Institute has a staff of over 120 people, grouped in small teams of specialists from several domains of modern biology. We are part of the Glaxo Group, which has an outstanding reputation for the quality of its research and products. We offer an excellent salary and benefits package, an interactive research environment, and opportunities for career development in one of the most attractive parts of Europe.

The ideal candidate will have several years of postdoctoral research experience and a proven track record in the field of membrane receptors or signal transduction mechanisms. Experience with animal cell cultures would be an advantage.

If you are interested in this position, please send your curriculum vitae with a list of publications and the names of three references to: Rita Gloor, Personnel Manager, GLAXO IMB SA, 46, route des Acacias, 1211 Geneva 24, Switzerland.

(W6040)A

### UNIVERSITY OF ABERDEEN UNIVERSITY OF ESSEX PROSAMO

#### POSTDOCTORAL AND GRADUATE RESEARCH ASSISTANTS AND TECHNICIANS IN MICROBIOLOGY, IMMUNOLOGY and ENVIRONMENTAL BIOTECHNOLOGY

PROSAMO is a major new interdisciplinary DTU/industry/AFRC funded three year project to develop methods that will provide the basis for assessment of the risks arising from the release of genetically manipulated plants and micro-organisms into the environment. The microbial programme will require the co-ordinated activities of a team of scientists at both Aberdeen and Essex Universities.

Applications are invited for the following posts from those with experience in microbiology, immunology, biochemistry, molecular biology or soil science.

At the *University of Aberdeen*: to work on the cloning of the *lux* gene system in soil bacteria, the construction of luminescent bacteria and the development of methods to extract and trace very small numbers of such bacteria added to laboratory microcosms and field samples.

3 postdoctoral (Ref LW/016) and 1 graduate research assistant (Ref LW/017), one of the postdoctoral positions to have a combined role in both centres.

At the *University of Essex*: to work on the development of polyclonal and monoclonal antibodies to use with fluorescent probes to identify genetically manipulated strains of bacteria in soil, detecting bacteria by means of flow cytometry and fluorescence activated cell sorting.

1 senior research officer (PDRA: Scale IA) (Ref R/864) and 1 Grade 5 technician (Ref N/865).

Salaries: PDRA, Scale IA (£9865-£12760); PGRA, Scale IB (£8675-£11680); Technician, Grade 5 (£8088-£9549). Appointments are renewable annually for up to three years.

Applications (3 copies) with full CV and the names of two referees should be sent to **The Personnel Office, University of Aberdeen, Regent Walk, Aberdeen, AB1 1FX** (for references LW/016 and LW/017) or to **The Registrar, University of Essex, Wivenhoe Park, Colchester, Essex, CO4 3SQ** (for references R/864 and N/865). Further details for the appropriate posts may be obtained from either of the above addresses. The closing date for applications is 5 May 1989. (8965)A

### UNIVERSITY OF READING

#### DEPARTMENT OF BIOCHEMISTRY AND PHYSIOLOGY

#### Postdoctoral Research Fellow and Graduate Research Officer

Applications are invited for the above posts in a new well equipped group to be set up in Reading actively to investigate at a biochemical level the role of lipoproteins in coronary artery disease. The projects will entail mainly tissue culture and studies of lipoprotein modification, for which full training will be given. The Fellowship is for one year in the first instance and is supported by the Wellcome Trust (salary up to £12760 p.a. under review). The Officership is for 2 years 3 months and is supported by the MRC (initial salary £8765 p.a. under review). Both posts are available immediately but starting dates are negotiable. Informal enquiries may be made to Dr. David S. Leake on 01-873-2315 or, after 1 May, (0734) 875123.

Apply for Application Form to **Personnel Officer, University of Reading, Whiteknights, P.O. Box 217, Reading RG6 2AH**. telephone (0734) 318754. Please quote Ref. R8922. (8961)A

### INSTITUTE OF CHILD HEALTH UNIVERSITY OF LONDON

#### Paediatric Cardiology MLSO Grade 3

Salary £15,711 to £17,515 inclusive

Skills essential:

- 1) Preparation of material for light and electromicroscopic examination, including Immunohistochemical techniques.
- 2) Experience with cell culture highly desirable.

The post includes responsibility for training and supervising laboratory staff.

To work in a high calibre research group in the Department of Paediatric Cardiology at the Institute of Child Health.

Further particulars available from the **Personnel Assistant, 30 Guilford Street, London WC1N 1EH** (tel 01-242 9789 ext 2650) to whom completed applications (3 copies) including the names of two referees, should be returned by 14 May 1989. Ref. MLSO3/PC/4/89. (8972)A

## THE GERTRUD – HAGMANN – STIFTUNG für Malignom – Forschung

has been established in Basle, Switzerland for the support of scientists performing basic or clinical research in oncology. Conditions for applicants are as follows:

1. Applicants must have obtained the doctoral degree either in Science or in Medicine.
2. They must have performed basic or clinical studies in biology or medicine at least two years prior to the application.
3. A funded scientist has to carry out his studies either in Austria, the Federal Republic of Germany or Switzerland.
4. He must be free of routine service or teaching obligations.

The stipend is sFr. 50,000.– per annum and shall provide the living expenses for the successful applicants.

Payments will be three-monthly in advance for two years. Reapplication is possible.

The Foundation will be gratified to receive applications of qualified female candidates.

Applications should be submitted within two months of this announcement to the **President Rainer Hagmann, M.D., Gertrud-Hagmann-Stiftung für Malignomforschung, Hauptstr. 14, CH 4514 Lommiswil, Switzerland**, and include the name and address of the applicant, a curriculum vitae, a complete list of publications including three copies of the most important papers, further a detailed description of the research project with references to previous works, the address of the institution where the investigation should be carried out with written consent of its director, specifying the time, when research should be started.

The council of the Foundation, with Prof. K. Brunner, M.D., Director of Oncology at the University of Berne, and Prof. G. Hartmann, Director at the Institute for Biochemistry at the University of München, serving as members, will notify the applicants of its decision within three months after the closing date of applications. (W6049)A

## Cancer Research Campaign

Fighting cancer on all fronts

Beatson Institute for Cancer Research

### POST-DOCTORAL SCIENTIST

A post-doctoral scientist is required to join a group working on the role of cell-cell interactions in the control of cell growth and differentiation, carcinogenesis and tumour suppression. The position offers an opportunity to develop an independent research project within an established epithelial cell biology and carcinogenesis programme. Candidates should be interested in the application of molecular and genetic techniques to problems of cell biology and cancer. There are good facilities for clinical collaboration when appropriate. Experience in cellular and/or molecular biology would be an advantage but training is available for applicants with proven ability in other fields. The appointment, for three years in the first instance, is funded by the Cancer Research Campaign as part of an ongoing research programme. It will be on the MRC Grade II scale (currently £11,070 to £14,500) with USS superannuation.

Applications, including a C.V. and the names of two referees, should be sent as soon as possible to **Dr John D. Pitts, Beatson Institute for Cancer Research, Garscube Estate, Bearsden, Glasgow, G61 1BD** (Tel: 041 942 9361). (8985)A

### JUNIOR FACULTY POSITION

available in the pharmacology and biochemistry of antineoplastic agents targeted against specific human cancer types. Studies will involve the modulation of anticancer agents with thymidylate synthase as the primary target. The focus will be on metabolism of reduced folates, modulation of reduced folate pools, and optimization of drug scheduling for therapeutic gain. Research will also identify factors that influence the regulation and turnover of thymidylate synthase in elucidating the importance of the enzyme as a therapeutic target. Candidates should have the Ph.D. degree with a minimum of 3 years postdoctoral experience. A strong background in Biochemistry is advantageous. Send curriculum vitae and names of 3 references to:

**Dr. J. A. Houghton,  
Laboratories for Developmental Therapeutics,  
Department of Pharmacology,  
St. Jude Children's Research Hospital,  
332 North Lauderdale, Memphis, TN 38101.**

## Molecular Biologists

### Two vacancies for experienced Research Scientists

Fisons is one of the most prestigious British pharmaceutical companies with an excellent reputation and clear commitment to new drug discovery. The company has made a substantial investment in immunological, cardiovascular and respiratory research and now wishes to establish a molecular biology unit within its Research laboratories in Loughborough.

Molecular biologists are required initially to support our immunosuppressive and cytokine programmes, but in the longer term to contribute to our receptor based approaches to new treatments for cardiovascular and respiratory diseases.

Applicants will have a PhD with up to three years relevant post doctoral experience. In addition, they should have a proven record of original research in molecular biology. A second position requires applicants who have graduated in biochemistry and have had experience in research using molecular biological techniques.

Successful applicants for both positions will need to be innovative and have the ability to communicate and implement ideas and to interact successfully with their colleagues as these are key positions within our expanding department of Biochemistry.

We offer excellent conditions of employment which include: profit sharing bonus, flexitime, a competitive pension scheme, 25 days annual holiday plus generous relocation assistance where applicable.

Please send your c.v. or write for an application form to:  
**Mrs Jane Thompson—Personnel Manager  
Fisons plc—Pharmaceutical Division  
Research and Development Laboratories  
Bakewell Road  
Loughborough  
Leics

## PROFESSOR OF ASTROPHYSICS WITH COSMOLOGY\*) AT STOCKHOLM OBSERVATORY

The University of Stockholm hereby announces a position as professor of astrophysics with cosmology at Stockholm Observatory open for application. The successful candidate will be expected to be actively engaged in research, to participate in teaching (in Swedish or English) including supervision of graduate students, and to take part in local, national, and international administration duties of the Observatory.

\*)The area of responsibility for the position covers the whole of astrophysics including cosmology. The candidate is required to have a scientific background within *either one* of these areas. The specialization can be observational or theoretical.

Application: The application should be made to "The Swedish Government" and the mailing address is:

**Rektorsämbetet  
Stockholm University  
S-106 91 STOCKHOLM  
Sweden**

The application should be accompanied by:

1. Detailed curriculum vitae and bibliography
2. Short written account of scientific work and teaching experience
3. Copies of records or documents that the applicant wishes to submit to verify his qualifications
4. Four reprints or preprints of each of the applicant's scientific publications numbered according to the publication list

Closing date: The formal application and documents under item 1 above must be received by the University not later than **May 8, 1989**. (It is advisable to submit the formal application by telex to 8105199 UNIVERS or telefax (0)8-159522.)

Documents under items 2-4 above must be received by the University not later than **May 29, 1989**. (W6038)A

# SENIOR POSTS IN RESEARCH ADMINISTRATION

The Medical Research Council wishes to appoint a small number of scientists to join its team of Scientific Administration Officers at the MRC Head Office in London.

Scientific Administration Officers act as one of the main channels of communication between those in universities, hospitals and research institutes whose research is supported by the MRC or who are seeking support, and the Council and its decision-making Boards and Committees. Each is assigned to take responsibility for the administration of research support in a specific scientific field.

Minimum qualifications are a good honours degree in a relevant science subject together with at least four year's relevant research experience. The successful candidates are likely to have had some proven post-doctoral research experience in an academic or commercial environment. Candidates will need to demonstrate a broad working knowledge of science and medicine, and have the analytical, communication and representational skills necessary to handle, after training, the complex administrative aspects of research management.

This is an unusual and challenging opportunity to move from research into strategic research administration. Appointments will be to the Senior Scientific Officer grade, which has a current salary of £14693 to £18782 (including London Weighting) plus a 4.5 per cent supplement for those joining the MRC Pension Scheme. Additional performance payments are available for the best staff. Conditions include pleasant office surroundings near Regents Park and flexible working hours.

**MRC**  
Medical Research Council

For application forms and further particulars apply by letter or telephone to **HQ Staffing Group, Medical Research Council, 20 Park Crescent, London W1N 4AL**. Tel 01-636 5422, Ext 447. Closing date: 5 May 1989. (8973)A

## ST GEORGE'S HOSPITAL MEDICAL SCHOOL (University of London) Department of Pharmacology CNS ELECTROPHYSIOLOGISTS

To study voltage and transmitter gated conductances of thalamic neurones, with particular emphasis to the thalamo-cortical projection cells of the lateral geniculate nucleus and the gabaergic cells of the perigeniculate nucleus.

Two post-doctoral positions are currently available for 17 and 36 months. They are supported by the Wellcome Trust with salary up to £11,680 (RIA scale) plus £1,650 London allowance per annum. Previous experience with electrophysiological techniques advantageous, but not essential.

Applications, with curriculum vitae and the names of 2 referees, should be sent to **Dr V Crunelli, Department of Pharmacology, St George's Medical School, Cranmer Terrace, London SW17 0RE, from whom further particulars can be obtained (tel. 01-672 9944 ext 55625). Please quote reference 48/89.** (8984)A

## CHARING CROSS AND WESTMINSTER MEDICAL SCHOOL (University of London) DEPARTMENT OF MEDICAL ONCOLOGY and CANCER RESEARCH CAMPAIGN LABORATORIES RESEARCH ASSISTANT

Applications are invited from post-doctoral biochemists and pharmacologists for a post supported by the Cancer Research Campaign. This post involves the development and pharmacology of a variety of potential new drugs in the treatment of cancer. Experience of pharmacological techniques and in particular HPLC is relevant. Salary within range £9,865-£15,720 p.a. plus £1,650 p.a. London Allowance, depending on age, qualifications and experience.

Applications in writing with full curriculum vitae together with the names and addresses of two referees to **The Secretary, Charing Cross and Westminster Medical School, The Reynolds Building, St Dunstan's Road, London W6 8RP**, to be submitted by 1st May 1989. (Quote Ref: 89/30) (8945)A

## UNIVERSITY OF ABERDEEN DEPARTMENT OF OBSTETRICS AND GYNAECOLOGY EMBRYOLOGIST

The Department of Obstetrics and Gynaecology, University of Aberdeen is setting up a Self-funding IVF Unit. This will be run within the University Department, but will have close links with an established NHS regional referral clinic. Facilities have been developed within a successful and productive research programme. Current projects include embryo diagnosis (cytogenetics and DNA probes) and ovarian control of gonadotrophin secretion. Our requirement is for an experienced embryologist with the ability to initiate an active clinical programme and at the same time take full advantage of the research opportunities. The appointment would be for one year in the first instance and salary will be within the range £9,865-£16,345 on the Research and Analogous Scales.

Informal enquiries to Professor Allan Templeton, Department of Obstetrics and Gynaecology, Maternity Hospital, Foresterhill, Aberdeen (tel 0224 681818 ext 52456).

Applications forms from the **Personnel Office, The University, Regent Walk, Aberdeen AB9 1FX** (tel 0224 273500) to whom applications (2 copies) should be returned by 12 May 1989 quoting reference number LW/019. (8956)A

## THE UNIVERSITY OF THE SOUTH PACIFIC

Alafua Campus, Western Samoa

## FELLOW IN ATOLL AGRICULTURE (Post 89/19)

Applications are invited for the post of Fellow in the Institute for Research, Extension and Training in Agriculture. The Institute is centred together with the School of Agriculture on the University's campus at Alafua in Western Samoa. The Fellow in Atoll Agriculture will be based upon a sub-station located in Tarawa, Kiribati, and will be responsible to the Director of IRETA for the continuation of ongoing research programmes into systems of farming to sustain yields of food crops, particularly vegetables, in an atoll environment. Applicants should possess a good first degree in agriculture, horticulture or applied science with preferably a higher degree in Agronomy or soil science and experience of tropical agriculture preferably in an atoll environment. Appointment, pending final confirmation of funds approved in principle, will be for a three year contract period with a possibility of extension for a further two-year period.

Salary will be in accordance with qualification and experience in the following scales: Junior Lecturer A\$14,154-15,882; Lecturer II A\$16,515-18,479; Lecturer I A\$19,132-A\$26,001; Senior Lecturer A\$26,833-31,354. Funding allows only citizens of the region and the European Community to be appointed. The University also provides gratuity amounting to 15% of basic salary; appointment allowance; partly furnished accommodation at a rental of 12.5% of salary; and a contribution of 10% of basic salary towards an approved superannuation scheme.

Further information may be obtained from the Secretary (Alafua Campus) (Telephone 21671; Telex 251 SX; Fax (685) 22933).

Candidates should send **THREE COPIES** of their curriculum vitae with full personal particulars, names and addresses of three referees and date of availability. In order to expedite the appointment procedure applicants are advised to ask their referees to send confidential reports direct to the University without waiting to be contacted. Applications should be sent to the Secretary, School of Agriculture, University of the South Pacific, Alafua Campus, Private Mail Bag, Apia, Western Samoa to reach him no later than **28 April 1989**. Applicants resident in the UK should also send a copy to **Appointments (36230), Association of Commonwealth Universities, 36 Gordon Square, London WC1H 0PF.** (W6046)A

MOLECULAR DESIGN OF NEW CROP-PROTECTION AGENTS

# Biophysical/ Physical-Organic Chemist

At Shell Research's Sittingbourne Research Centre, Molecular Design brings together many skills in a large multi-disciplinary team supported by extramural research. We have a vacancy in this team for a scientist with skills in biophysical or physical-organic chemistry.

A clear understanding is needed of the properties required in effect-chemicals and of how these may be realised in a molecular structure. We are looking for scientists experienced in characterising and quantifying enzyme functions and interaction with substrates and inhibitors, using spectroscopic and other physical methods. We also invite applications from people experienced in investigating transport and related physical processes which determine a compound's properties within an organism and its delivery to a target. We seek candidates who have academic or industrial postdoctoral experience in an appropriate field, good communication skills and a willingness to work across traditional scientific boundaries.

Our Research Centre is a modern, well-equipped laboratory on a 500 acre rural site in Kent, offering a wide range of intellectual challenges and opportunities for career development. We offer attractive salaries, good sports and social facilities and a staff restaurant.

If you are interested in the above position, please write or telephone for an application form, quoting reference number SRC5/89 (Biophysical Chemist) to: Mrs Diane King, Personnel Division, Shell Research Limited, Sittingbourne Research Centre, Sittingbourne, Kent, ME9 8AG. Tel: (0795) 412290. Closing date for receipt of applications 27th April 1989.

### **Post-doctoral Biochemist**

required to take part in a broad programme of research on medical aspects of proteolytic enzymes and their inhibitors. Relevant experience would be a great advantage.

MRC conditions of service, U.S.S. benefits, salary in the range of £11070-£15720. Applications with curriculum vitae and names of 2 referees should reach Roger Lawrence at the above address by 30th April.  
(8946)A

The Universities of Strasbourg, Freiburg im Breisgau, Karlsruhe and Basel have created a trinational curriculum in Biotechnology. The

### Faculty of Sciences of the University of Basel

has assumed the responsibility for the teaching of *Microbiology* in this curriculum, and for this purpose a new

### Professorship in Biotechnology

has been funded for January 1, 1990.

The duties will include:

- ☆ Organisation and execution of Microbiology teaching in the new curriculum with the help of the existing infrastructure.
- ☆ Research on an aspect of Microbiology relevant to Biotechnology.
- ☆ Participation in advanced level teaching at the Biozentrum of the University of Basel.

The University will provide core support in the form of salaried positions, equipment and running expenses.

Applications including a curriculum vitae, list of publications, reprints of about five representative publications, a short overview of past and planned research activities and a description of teaching experience should be submitted before June 1, 1989, to the

**Dean of the Faculty of Sciences**

at the following address:

**Dekan der Philosophisch-Naturwissenschaftlichen Fakultät,  
Klingelbergstrasse 23, CH-4056 Basel, Schweiz.**

Further information on the curriculum in Biotechnology and on the Biozentrum is available on request. (W6044)A

## DIRECTOR NORTHWESTERN UNIVERSITY INSTITUTE FOR NEUROSCIENCE

Applications and nominations are invited for the Directorship of the newly formed Institute for Neuroscience at Northwestern University. This is a University wide institute whose members come from 10 departments spread across four schools and several teaching hospitals. Current Institute membership exceeds 50 faculty. The Director will be expected to oversee the University-wide commitment to further expand faculty and research activities in the neurosciences. The Director will become the incumbent of an endowed Chair in Neuroscience. Candidates are expected to be internationally recognized leaders in the field of Neuroscience.

Those interested should submit an up to date curriculum vitae along with the names of four references to:

**Dr. Robert D. Goldman  
Chairman**

**Institute for Neuroscience Search Committee  
Department of Cell Biology and Anatomy  
303 East Chicago Avenue  
Chicago, Illinois 60611-3008**

## Postdoctoral Research/Immunology Department of Medicine and Graduate Program in Immunology Tufts University School of Medicine

Postdoctoral fellowship available to study systemic autoimmune disease in mice and humans: Organization/expression of genes encoding pathogenic autoantibodies & the structure/specificity of T cell receptors used by pathogenic autoantibody-inducing T cells (see: J. Immunol. 138, 128-137, 1987; J. Exp. Med. 165, 1252-1268, 1987; PNAS. 84, 6850-6853, 1987; J. Immunol. 140, 2215-2224, 1988).

Experience in molecular biology techniques preferred. Send résumé and names of three references to: **Dr. Syamal K. Datta, Department of Medicine, Box 52, Tufts University, New England Medical Center, 750 Washington Street, Boston, MA 02111.** (NW3595)A

## KENT

## Research Fellow in Molecular Biology

Applicants are invited for a post of Research Fellow to undertake a study of the mechanism of protein synthesis in the fungal pathogen *Candida albicans* using a range of molecular biology techniques. Applicants should have a PhD or be in the process of submitting for a PhD, in the areas of molecular biology, genetics or biochemistry. The successful applicant will join a well established group at the University of Kent currently studying various aspects of protein synthesis in yeasts, under the direction of Dr M F Tuite.

The project is funded by Glaxo Group Research. An appointment will be made on the RA1A scale (£9,865 to £15,720 per annum) for two years in the first instance, with the possibility of a further appointment for one year. The starting date is negotiable.

Enquiries about the post can be made to Dr M F Tuite on (0227) 764000, ext 3699.

Application forms and further particulars may be obtained from **Mr J E Reilly, Secretary of Faculties and Deputy Registrar, The Registry, University of Kent at Canterbury, Kent CT2 7NZ** quoting reference A89/38. Closing date: 5 May 1989.

*The University of Kent is an equal opportunities employer.* (8974)A

## THE AUSTRALIAN NATIONAL UNIVERSITY

Applications are invited for appointment to the following position:

**NORTH AUSTRALIA RESEARCH  
UNIT**

**POSTDOCTORAL FELLOW  
RESEARCH FELLOW/  
SENIOR RESEARCH  
FELLOW**

Task: to initiate work on policy problems associated with the use, development and conservation of the natural resources, especially savanna land, of Northern Australia.

Qualifications: A PhD in economics, agricultural economics, or natural resource management or experience in the analysis of resource related problems is essential. Postgraduate research experience in the relationship between social and ecological sciences would be an advantage.

Post: Full time research, available January 1990, location Darwin, Australia. Secondment from other institutions considered.

Details: A short statement of proposed research is to be submitted with the application. Further details from the Executive Director, NARU, PO Box 41321, Casuarina, NT 0811, Phone (089) 275688, FAX (089) 450752.

Closing date: 30 June 1989. Ref PA 30.3.3.

**SALARY** Senior Research Fellow; A\$42,582-A\$50,619 p.a. Research Fellow A\$30,737-A\$40,100 p.a.; Postdoctoral Fellow Grade 1 (fixed point); A\$26,617-A\$30,360 p.a. **APPOINTMENT:** Senior Research Fellow/Research Fellow up to three years, possibility of extension to five years; Postdoctoral Fellow normally two years, possibility of extension to three years. **APPLICATIONS** should be submitted in duplicate to the Registrar, The Australian National University, GPO Box 4, Canberra ACT 2601, Australia, quoting reference number and including curriculum vitae, list of publications and names of at least three referees. The University reserves the right not to make an appointment or to appoint by invitation at any time. Further information is available from the Registrar, or from Appointments (36235), Association of Commonwealth Universities, 36 Gordon Square, London WC1H 0PF.

## POSTDOCTORAL FELLOW/ RESEARCH FELLOW NEUROCHEMISTRY/ NEUROPHARMACOLOGY

Reference No. 12/04

DEPARTMENT OF PHARMACOLOGY

Higher degree graduate in pharmacology, physiology, biochemistry or a related discipline to work on a NH&MRC Program Grant "Neurochemical pharmacology of amino acid transmitters in the nervous system". We are particularly interested in a person able to lead investigations on the interactions of steroids with GABA neurotransmitter systems and/or the roles of amino acid neurotransmitters in various neurological disorders. The position is available for 1 year in the first instance with possible extension until the end of 1991. The level of appointment and responsibility will depend on the appropriate qualifications and experience of the appointee. Further information from Professor Graham Johnston or Dr Robin Allan, (02) 692 2408, FAX (02) 692 3868.

**SALARY:** Postdoctoral Fellow \$A26,617-\$A29,611 per annum.  
Research Fellow \$A30,737-\$A40,100 per annum.

**METHOD OF APPLICATION:** Applications, quoting reference no., including curriculum vitae, list of publications and the names, addresses and FAX numbers of three referees, to the Registrar, Staff Office, University of Sydney, NSW 2006, Australia, by 24 April, 1989. (W6048)A

*Equal employment opportunity is University policy*

## UNIVERSITY OF SURREY HIGH PRESSURES AND LOW DIMENSIONAL SYSTEMS Research Fellow

A co-operative SERC project between physics groups in six universities (Cambridge, Edinburgh, Imperial College (London), Nottingham, Oxford and Surrey) and the SERC High Pressure Facility at STC Technology Ltd Harlow, and supported in part by STC funding, requires the recruitment of a post-doctoral research fellow: a physicist or physical chemist with some understanding of compound semiconductors, their band structure and optical and photoluminescent properties. The successful candidate would develop measurement techniques at very high pressures based mainly on diamond anvil cells, and transfer these to laboratories collaborating in the SERC Low Dimensional Systems Initiative. This is challenging work requiring creative insight combined with considerable practical skill.

The research fellow will be attached to the University of Surrey but would work at the SERC High Pressure Facility at Harlow (the only SERC Facility in an industrial research centre, and a small unit used by researchers from all over the country). The appointment will be for a period of up to three years. Salary will be on the Research and Analogous Range 1A scale according to age, experience and qualifications. Further information can be obtained from Professor C H L Goodman, Director SERC High Pressure Facility, STC Technology Ltd., London Road, Harlow, Essex CM17 9NA, tel 0279 29531 ext 3308.

Applications in the form of a curriculum vitae (3 copies) including the names and addresses of two referees, should be sent to the **Personnel Office (JLG), University of Surrey, Guildford GU2 5XH**, quoting ref 833N by 5 May 1989. (8986)A

## University of Bristol SCHOOL OF VETERINARY SCIENCE CHAIR IN VETERINARY MEDICINE

Applications are invited for the Chair in Veterinary Medicine which has fallen vacant following the resignation of Professor FJ Bourne. Candidates, who must have a veterinary qualification, should submit applications, including the names of three referees, not later than 31 May 1989. Full particulars of the appointment may be obtained from the **Registrar, University of Bristol, Senate House, Bristol BS8 1TH**. (8980)A

## POSTDOCTORAL RESEARCHERS

The "Biomolecular Mechanisms" section of the Los Alamos National Laboratory has openings for postdoctoral fellows. Research conducted in this program includes:

- 1) Studies on the vertebrate rod, a single photon detector that can regulate its sensitivity over a wide dynamic range. We are examining the fine control of those gene products which regulate the photon-sensitive membrane current in this photoreceptor cell.
- 2) Studies on the microangiopathy of diabetes, a primary cause of human blindness and renal failure. We are examining the regulation of sodium transport and cell volume in mammalian erythrocytes and the reversible impairment of Na<sup>+</sup> transport and red cell swelling found in hyperglycemic states.
- 3) The differential excretion of glycated and unmodified albumins by the mammalian nephron is correlated with age. We are examining age related changes in the biochemical composition and physical properties of selected basement membrane structures.

Applicants should have a strong background in protein chemistry and enzyme regulation, a doctoral degree obtained in the past three years, and must qualify for a Department of Energy "Q" security clearance. Postdoctoral appointments are for one year, renewable for a second year. The salary range is \$33,640-\$35,445 per year. Please send a curriculum vitae to Dr. Mark W. Bitensky, Senior Fellow, ADR, MS D434, Los Alamos National Laboratory, Los Alamos, NM 87545. (505) 667-9420.

To apply formally, send resume, employment application, graduate and undergraduate transcripts and three letters of reference to Carol M. Rich, Human Resources Development Division, PD-89-060, Los Alamos National Laboratory, Los Alamos, NM 87545.

Affirmative Action/Equal Opportunity Employer

University of California

(NW3601)A

# Los Alamos

## DEPARTMENT OF PHARMACEUTICAL SCIENCES CONTRACT RESEARCH ASSISTANT/ RESEARCH FELLOW

Applications are invited for the above appointment to work with Dr. P. J. Hanson on a project funded by the Medical Research Council to investigate the signal transduction mechanisms involved in the inhibition of gastric acid secretion by epidermal growth factor.

Applicants should possess, or expect to attain a 1st or 2(i) honours degree in biochemistry, cellular physiology or a related discipline. Candidates for appointment at Research Fellow level will be expected to have undertaken a PhD degree. The position is available for three years from 1 October, 1989.

**Starting salaries** (according to age and experience):

Research Fellow (Research Grade 1A): £9,865 to £15,720 p.a.

Research Assistant (Research Grade 1B): £8,675 to £11,680 p.a.

Application forms and further particulars may be obtained from the Personnel Officer (Academic Staff), quoting Ref:897/6, Aston University, Aston

Triangle, Birmingham B4 7ET. Tel: 021-359 0870 (24 hour answer-phone). Closing date for the receipt of applications is 4th May, 1989.

ASTON UNIVERSITY

(8944)A

## POSTDOCTORAL AND RESEARCH ASSOCIATE POSITIONS MOLECULAR VIROLOGY/BIOLOGY

Postdoctoral and research associate positions are available (beginning Summer, 1989) to participate in ongoing research on the molecular biology, virology, and pathogenesis of the simian and feline immunodeficiency viruses (SIV and FIV). The applicant would be a member of an NIH-funded multidisciplinary group developing animal models for AIDS. Newly constructed laboratory space (including BL-3 facilities) is available and is equipped with state-of-the-art instrumentation (including DNA synthesizer, automated DNA sequencer, PCR cyclers, etc).

Applicants should possess a Ph.D., M.D. or D.V.M. degree and have demonstrated skills in basic molecular biology techniques. Salary will be commensurate with experience and expertise. Interested candidates should send a curriculum vitae and the names of three references to:

**Dr. Philip R. Johnson**

**Division of Molecular Virology and Immunology,  
Department of Microbiology**

**Georgetown University School of Medicine  
NIH/Twinbrook II**

**12441 Parklawn Drive, Rockville, MD 20852**

*Georgetown University is an Equal Opportunity/  
Affirmative Action Employer (NW3587)A*

## UNIVERSITY OF MAINE POTATO BIOTECHNOLOGY PROGRAM

### TWO POSTDOCTORAL RESEARCH ASSOCIATES

Applications are invited for two postdoctoral scientists to join a group working on the molecular biology of disease resistance genes in potato. The group works in well equipped laboratories and specialist training is available in a wide range of techniques.

The appointments are for two years with extension contingent upon continued funding. Experience with recombinant DNA techniques or plant transformation and tissue culture is desirable. Salary commensurate with experience.

Send curriculum vitae and three letters of reference by 5/15/89 to **Dr. Stellos M. Tavantzis** or **Dr. Michael E. Vayda**, 178 Hitchner Hall, University of Maine, Orono, ME 04469, U.S.A.

An EEO/AA institution

(NW3588)A

## UNIVERSITY COLLEGE OF SWANSEA

### RESEARCH ASSISTANT

Applications are invited for the vacancy of Research Assistant, in the School of Biological Sciences, to work on the mechanism of immunorecognition in insects with Professor N A Ratcliffe and Dr A F Rowley. The project is funded by S.E.R.C. and will include raising monoclonal antibodies to insect cells and the subsequent testing of these molecules. Applicants should have a degree in biology, biochemistry or immunology and preferably some further research experience.

The post is tenable for up to 3 years, at a commencing salary of up to £10,460 per annum, plus USS/USDPS benefits.

Informal enquiries may be made directly to Dr A F Rowley (0792) 295455, but further particulars and application forms (2 copies) must be obtained from the **Personnel Office, University College of Swansea, Singleton Park, Swansea SA2 8PP**, to which office they should be returned by **Friday 5 May 1989**. (8988)A

## POSTDOCTORAL POSITION

### Membrane Biophysics

Areas of interest include lipid polymorphism and its relationship to membrane fusion, the regulation of membrane-bound enzymes and multi-drug resistance.

Highly qualified individuals please send full curriculum vitae and names of two references to: **Dr. R.M. Epand, Dept. of Biochemistry, McMaster University Health Sciences Centre, 1200 Main Street West, Hamilton, Ontario, Canada, L8N 3Z5**. (NW3583)A

## ASSISTANT/ASSOCIATE PROFESSOR IN SEDIMENT GEOCHEMISTRY

The College of Oceanography at Oregon State University is seeking applicants for a tenure track position in sediment geochemistry at the Assistant or Associate Professor level. Applicants who have ongoing research programs which complement and augment one or more of the existing OSU programs in Pleistocene paleoclimatology, sedimentation and fluid circulation at convergent margins, contemporary sedimentary cycling, benthic fluxes, geochemical tracers of ocean circulation and productivity, or seawater hydrothermal systems are urged to apply. The College of Oceanography is well equipped for research in these areas with facilities for: stable isotope and noble gas mass spectrometry, XRF, XRD, AAs, electron microprobe, neutron activation, particle flux measurement, radiochemistry, and a UNIX computer network. Although the successful applicant is expected to teach, the usual teaching load is limited to one or two courses per year. Salary, a portion of which is state-supported, is commensurate with experience and academic rank. Applications including vitae, grant list, and names, addresses, and phone numbers of three references must be received by 1 May 1989. Send to: **Douglas R. Caldwell, College of Oceanography, Oregon State University, Oceanography Admin Bldg 104, Corvallis, OR 97331-5503**. Oregon State University is an AA/EEO employer, complies with Section 504 of the 1973 Rehabilitation Act, and has a policy of being responsive to the needs of dual-career couples. (NW3599)A

## UNIVERSITY COLLEGE DUBLIN

### DEPARTMENT OF GEOLOGY

Applications are invited for a temporary, academic appointment in the Department of Geology. This appointment will be for nine months from 1st October, 1989 to replace a staff member on leave of absence and will be made at the level of Assistant Lecturer. Duties will include the teaching of metamorphic petrology, geotectonics and Precambrian Geology to undergraduates in all years and some service teaching to students from other faculties.

The current salary scale for an Assistant Lecturer is Ir£10,566-Ir£16,958. Entry point on this scale will be in accordance with qualifications and experience.

Prior to application, details of application procedure should be obtained from the Secretary, University College Dublin, Belfield, Dublin 4. Telephone enquiries: 693244, ext. 1431.

The closing date for receipt of completed applications is Thursday, 11th May, 1989. (8970)A

University of Zürich  
Faculty of Medicine and  
Faculty of Natural Sciences

## FACULTY POSITION IN BIOCHEMISTRY

Applications are invited for a tenured faculty position (associate professorship, Extraordinariat) at the Department of Biochemistry. Candidates are expected to have a creative research programme in protein biochemistry and a genuine interest in the teaching of biochemistry to medical and science students.

Applications including curriculum vitae, bibliography synopsis of past and planned future research, and a record of teaching experience should be sent to the Chairman of the Search Committee, Professor Christian Bauer Physiologisches Institut der Universität Zürich, Winterthurerstr. 190, CH-8057 Zürich, Switzerland.

Deadline June 15, 1989.

(W6022)A

## Postdoctoral Positions in Molecular Genetics

Applications are invited for 2 postdoctoral positions in the Molecular Genetics group of Ciba-Geigy Ltd, Basle, for a period up to three years. Candidates are expected to participate in; (i) a mouse molecular genetics program to generate mouse models for human diseases using gene transfer and homologous recombination strategies in mouse embryonic stem cells, (ii) a polypeptide growth factor program to generate gene-specific hybridisation procedures for studying the *in situ* localisation and expression of different growth factors in mammalian tissues. Candidates should have a PhD with 0 – 3 years postdoctoral experience preferably with training/expertise in mammalian tissue culture techniques (i) or histopathology (ii). Experience with recombinant DNA technology is desirable for both positions.

Ciba-Geigy is a major pharmaceutical company with an active interest and engagement in molecular biology. The Molecular Genetics section is located in the company's main research facility situated in Basle, Switzerland. Basle is a major centre for both pure and applied research in molecular biology, and provides a stimulating environment in every respect.

Applications including a curriculum vitae, a summary of relevant research background and the names of two referees should be sent under ref. "Nature 348" to Mr. H. Schmid, Ciba-Geigy Ltd, Personnel Department, P.O. Box, CH-4002 Basle. W(6043)A

## UNIVERSITY OF SUSSEX SCHOOL OF BIOLOGICAL SCIENCES RESEARCH OFFICER/RESEARCH FELLOW

A research fellow (preferably post-doctoral) is required to join a project on the mechanisms involved in the repair of DNA replication errors in human cells. The work involves the construction and transfection of viral vectors as well as DNA sequencing and possibly some *in vitro* work.

The person should preferably have experience of, or a strong desire to learn either molecular biology or tissue culture. The post is funded by the CRC for 2½ years and is available after 1st May, 1989. Salary will be on the scale £8,675-£11,680 p.a. or £9,865-£15,720 p.a., according to qualifications and experience.

Applications should be made to Dr. J.F. Burke, School of Biological Sciences, University of Sussex, Falmer, Brighton BN1 9QG. Tel (0273) 678308.

AN EQUAL OPPORTUNITY EMPLOYER

(8967)A

## Texas A&M University Department of Entomology

**Postdoctoral Research Associate** position available immediately for 2 years at Texas A&M University, Department of Entomology, College Station, Texas to study molecular biology of gene expression using recombinant forms of a genetically engineered baculovirus. Successful applicant should be training in recombinant DNA techniques; experience in cell and tissue culture also required for the conduct of the research. Salary \$22-25,000. Send curriculum vitae and names of three references preferably by May 15, 1989 to Dr. Max D. Summers, Distinguished Professor, Department of Entomology, Texas A&M University, College Station, Texas 77843. An equal opportunity employer. (NW3600)A

## Northern Ireland Civil Service

### HEAD OF AQUATIC SCIENCES RESEARCH DIVISION (SENIOR PRINCIPAL SCIENTIFIC OFFICER)

**Salary: £21,633-£28,170**

**Closing Date: 5 May 1989**

**Reference: SB 38/89**

**Tel: Ext. 2304**

#### DEPARTMENT OF AGRICULTURE (NORTHERN IRELAND)

Applications are invited for the Head of Aquatic Sciences Research Division, a newly organised DANI Research Division. The successful candidate will be responsible for the management of some 40 scientific staff and all aspects of their research and technical work in the Aquatic Sciences field. He/she will also be responsible for the line management of all aspects of the research division. The principal task will be to initiate and maintain an innovative basic and strategic research programme of direct relevance to DANI's responsibilities for agriculture and fisheries. He/she will also be responsible for the conduct of other scientific and technical programmes in this area.

The postholder will also manage, via a non-government agency, DANI's marine research vessel and its scientific programme around the coasts of Britain and Ireland. He/she may be required to lecture to under-graduates in the Faculty of Agriculture—Queen's University, Belfast.

The successful candidate must possess a PhD in a relevant scientific discipline and have a proven track record of research in marine/fresh water aquatic science.

In addition he/she must have demonstrable ability and experience in managing staff, finance and other resources, managing multi-disciplinary scientific teams and attracting outside funding. Substantial sea-going experience on medium to large marine research vessels and a sound knowledge of on-board scientific techniques, working practices and associated management procedures would be highly desirable. Experience in an international context at research and/or other levels would be an advantage.

Starting salary will be in the range £21,633 to £28,170 with further increments payable, depending on performance, up to a maximum of £32,826.

The Civil Service Commissioners may decide to interview only those applicants who appear, from the information available, to be most suitable in terms of experience and academic qualifications.

Please write to the Civil Service Commission, Rosepark House, Upper Newtownards Road, Belfast BT4 3NR or telephone Dundonald 4567 for an application form (using the extension number indicated and quoting the Job Reference). Completed forms must be returned to arrive not later than the closing date stated. (8966)A

The Northern Ireland Civil Service is an Equal Opportunity Employer. Its posts are open to both men and women and applications are welcome from disabled persons.

of science

### UNIVERSITY OF BIRMINGHAM DEPARTMENT OF SURGERY Queen Elizabeth Hospital

#### CANCER RESEARCH CAMPAIGN FUNDED RESEARCH ASSOCIATE/RESEARCH FELLOW

Applications are invited from scientists at post-graduate or post-doctoral level interested in an investigation into the novel effects of bile acids and their metabolites on the growth and steroid receptor activity of human breast cancer cells and tissues.

The project is part of a larger programme of research currently being established in the Department of Surgery into the role of bile acids, steroids and lipids in the biology of human cancers. The successful candidate will have the opportunity to make a major contribution of the bile acid/breast cancer study and to play a key role in the future direction of the groups research programme. Experience in cell and tissue culture techniques would be an advantage but is not essential.

Appointment is for up to two years on the Research Associate 1B (£8675 – £11680) or Research Fellow 1A (£9865 – £15720) Scale with superannuation.

Informal enquiries to Dr. P. R. Baker, Tel 021 414 4103.

Application forms with further particulars from **Senior Assistant Registrar, The Medical School, B15 2TJ by 5 May 1989.**

**Quote Ref. RF/Surg/PB4**

**AN EQUAL OPPORTUNITIES EMPLOYER**

(8947)A

### UNIVERSITY OF ST ANDREWS Department of Biology and Preclinical Medicine LECTURESHIP IN BIOLOGY

Applications are invited for the above post from candidates with a strong research record in any area of Plant Biology. Candidates interested in Plant Molecular Biology and/or Pathology will be welcome provided that they have a broad background in Plant Biology.

The appointment is tenable from 1st October 1989 and the salary will be on either the Lecturer Grade A scale £9,260 to £14,500, or Grade B scale £15,105 to £19,310 per annum, initial appointment probably on the Grade A scale.

Further particulars and application forms are available from the **Director of Personnel Services, The University, College Gate, St Andrews, Fife KY16 9ANJ, to whom applications should be submitted not later than 25th April 1989.** (8906)A

### UNIVERSITY OF LIVERPOOL Chair of Veterinary Anatomy

Applications are invited for the Chair of Veterinary Anatomy. The Chair will be held in the Department of Veterinary Preclinical Sciences, in the Faculty of Veterinary Science. Preferred applicants will have leadership experience in research and teaching within morphological sciences appropriate to veterinary medicine.

The salary will be within the range approved for non-clinical professorial salaries, currently not less than £24,499 per annum.

Applications, together with the names of three referees, should be received not later than 31 May 1989, by **The Director of Staffing Services (AS), The University, P.O. Box 147, Liverpool, L69 3BX,** from whom further particulars may be obtained.

**Quote Ref. RV/322.**

**An Equal Opportunity Employer**

(8998)A

### UNIVERSITY OF STIRLING LECTURER IN CHEMISTRY

Applications are invited for the post of Lecturer in Chemistry within the newly formed School of Molecular and Biological Sciences. Applicants should have a good background in Physical Chemistry and preference will be given to those who can show that their area of research would allow an interface with the Biological Sciences. The appointment will be on the Grade A scale, currently £9260-£14500 (under review).

Applications including a c.v. and the name of three referees should be sent by 5 May 1989 to **The Staff Office, University of Stirling, Stirling FK9 4LA; Tel: 0786, 73171, Ext 2314,** from whom further particulars may be obtained. (8992)A

THE AFRC INSTITUTE OF  
HORTICULTURAL  
RESEARCH

East Malling

Higher Scientific Officer

A plant Physiologist/Biochemist (HSO Band I) is required to develop a programme on stress physiology under the guidance of the Head of Division (Dr H.G. Jones). The objectives of the work are to identify the biophysical and biochemical mechanisms involved in plant response to and adaptation to environmental stress. The appointee would act as local co-ordinator of the stress physiology group at East Malling.

Qualifications: First or Upper Second class honours degree in an appropriate subject plus at least 2 years' relevant postgraduate experience, or equivalent. Experience in biophysical or biochemical research on aspects of plant stress physiology. Experience in water relations and photosynthesis (including fluorescence) research or plant developmental physiology an advantage.

Salary: In range £10,026-£13,460.

Further details and application form from the Personnel Officer, Institute of Horticultural Research, Bradbourne House, East Malling, Maidstone, Kent ME19 6BJ. Closing date 4th May 1989.

The AFRC is an Equal Opportunities Employer (9003)A

# RHONE-POULENC SANTE

The health division of France's principal chemical group

Invites applications from experienced molecular biologists for three RESEARCH SCIENTIST posts in its newly built Biotechnology Institute near Paris.

## Streptomyces molecular genetics

This position requires a Ph.D. in bacterial molecular biology as well as a minimum of 3-4 years' post-doctoral experience in the Streptomyces field. Familiarity with recombinant DNA technology in Streptomyces microorganisms, as well as experience in cloning genes involved in secondary metabolism, is essential. Réf. 50425/A.

## Mammalian cloning technology

Qualified candidates for this position will have a Ph.D. and good post-doctoral experience in the cloning and analysis of mammalian cDNAs or genes. A proven record of achievement using up-to-date DNA cloning strategies (construction of cDNA libraries in various vectors: screening by oligonucleotide hybridization, immunodetection or expression, subtractive hybridization...) is essential. Réf. 50425/B.

## Transgenic animals

This position requires a Ph.D. level in cellular and molecular biology and a good post-doctoral experience in the production and use of transgenic animals. The candidate should be able to develop a small unit for the production and genetic analysis of transgenic animals. Réf. 50425/C.

Please send your full resume quoting the reference to Media-System, 6/8 impasse des Deux Cousins, 75849 Paris Cedex 17, France.

(W6053)A

## KING'S COLLEGE LONDON Research Associate

Applications are invited from scientists with experience in the application of physical biochemistry and molecular genetics to the study of DNA binding proteins and mechanisms of gene regulation. This position in Professor Gould's group, available for two years from July 1989, will involve studies on the interactions between nucleosomes on specific gene sequences and known regulatory proteins. Annual inclusive salary up to £17,370 according to age and experience.

Applications (*curriculum vitae* and the names and addresses of two referees) should reach **Mr D M Drummie, Biophysics Laboratories, King's College London, 26-29 Drury Lane, London WC2B 5RL**, by 27 April 1989.

(9000)A

## UNIVERSITY OF NEWCASTLE UPON TYNE CHAIR OF BIOCHEMISTRY

Applications are invited for the Chair of Biochemistry which has recently become vacant on the retirement of Professor K. Burton, F.R.S.

The person appointed will be expected to provide academic leadership in research and teaching within the Department of Biochemistry and Genetics. The Department is in the Faculty of Science, is a member of a Cross-Faculty School of Biomedical and Biomolecular Sciences and is located in the new Medical School. This offers opportunities for collaboration within a broad area of research.

Salary will be at an appropriate point on the Professional salary scale. Further particulars may be obtained from the **Deputy Registrar, the University, 6 Kensington Terrace, Newcastle upon Tyne, NE1 7RU** with whom applications (15 copies), giving the names of three referees, should be lodged not later than 26th May 1989. (*Applicants from outside the U.K. may submit one copy only*). (8987)A

## ROYAL POSTGRADUATE MEDICAL SCHOOL (University of London)

### Department of Paediatrics and Neonatal Medicine Jerry Lewis Muscle Research Centre POSTGRADUATE RESEARCH ASSISTANT

To work on the structure and regulation of potassium channels in skeletal muscle, using specific toxins, monoclonal antibodies and cDNA probes. Experience in these areas and/or with membrane biochemistry, FPLC and tissue culture and advantage, but not essential. The post is available from October for three years and is funded by the Muscular Dystrophy Group of Great Britain. Applicants should either hold or expect to gain a good honours degree. The successful candidate will, in appropriate circumstances, be eligible to register for a higher degree. Salary: up to £9260 plus London Allowance of £1650.

For informal enquiries, please contact **Dr Peter Strong (01-743 2030 ext 2124)**. Application forms and further information from the **Personnel Office, Royal Postgraduate Medical School, London W12 0NN (tel: 01-740 3204) quoting reference ANW8**. Closing date 8 May 1989. (9001)A

## University of Bristol TEMPORARY LECTURER IN ANATOMY

Applications are invited for a Temporary Lectureship in Anatomy for the session 1989/90. Applicants should have special interests in embryology and reproductive biology. The post is funded by the Wellcome Trust to provide research leave for Dr. Claire Wathes and the appointee will be required to teach medical and veterinary students. Salary in the range £12,150-£13,365 per annum (under review).

Applications (in duplicate) stating age, qualification, and including the names and addresses of three referees, should be sent by 5 May 1989 to **The Registrar, University of Bristol, Senate House, Bristol BS8 1TH** from whom further particulars may be obtained. Please quote reference TLJ. (8994)A

## Overseas Development Natural Resources Institute

# Ruminant Nutritionalists

## Chatham Based

The Animal Products and Feed Department of the ODNRI is concerned with post-harvest aspects of fish, meat, hides and skins, dairy products and animal feeds.

Two posts are available to work on developing programmes aimed at improving livestock production through improvements in nutrition. This will involve close collaboration with a wide range of professional staff and will entail co-operation with centres overseas. The work involves long and short assignments in developing countries.

For both posts you should have a good honours degree and a higher degree is desirable.

For the higher post (Ref: S/F/677) you will probably have 10 years' or more relevant experience including extensive cattle production in developing countries.

For the second post (Ref: SB/66/JD) you must have at least 2 years' relevant experience. Experience of applied nutrition of sheep, goats or cattle in developing countries would be an advantage.

Starting salary is in the range £10,505-£22,605 (depending on qualifications and experience) with further increments, depending on performance, up to £26,955 (for the higher post). In addition posts in London attract Inner London Weighting of £1750 per annum.

The Overseas Development Natural Resources Institute will be relocating to Chatham, Kent in late 1989. Prior to that date employment will be in London or at Culham (Oxfordshire).

For further details and an application form (to be returned by 28 April 1989) write to Civil Service Commission, Alencon Link, Basingstoke, Hants RG21 1JB, or telephone Basingstoke (0256) 468551 (answering service operates outside office hours). Please quote appropriate reference number.

The Civil Service is an equal opportunity employer

## INSTITUTE OF ANIMAL PHYSIOLOGY AND GENETICS RESEARCH EDINBURGH

Two IMMUNOLOGISTS are required, one as project leader and the other as research assistant, to study cellular immune responses in cattle to the protozoan parasite *Theileria annulata*. The research is directed towards production of a molecular vaccine and will concentrate particularly on the identification of T cell epitopes on relevant parasite antigens. An active programme of research on the MHC and its role in T cell immunity is ongoing in the department and the Institute is very well equipped for both cellular immunological and molecular biological research.

The appointment will be at Senior or Higher Scientific Officer levels for the project leader and Scientific Officer for the research assistant.

Qualifications for the SSO/HSO are a Ph.D with at least three years relevant post graduate experience in Immunology; for the SO post a 1st or 2.1 honours degree in a relevant subject. The SO may be able to study for a Ph.D.

The project is financed under the EEC programme of Science and Technology for Development will be for 3 years and will involve collaboration with workers in Morocco, the Centre for Tropical Veterinary Medicine, University of Edinburgh and the Wellcome Unit of Molecular Parasitology in Glasgow.

Salary: In scale SSO £12445-£17032. HSO £10026-£13460.  
SO £8574-£10994.

Further information can be obtained from Dr. R.L. Spooner or Dr. E.J. Glass at the Department of Immunogenetics. Telephone 031-667-6901. Application forms from the **Personnel Officer, Mrs. L. Hunter at the Institute of Animal Physiology and Genetics Research, Roslin, Midlothian, EH25 9PS**. Completed application forms must be returned by 5th May 1989. (8963)A

## Senior Technician Grade 8C (Molecular Biology/Genetics and Biochemistry)

Salary Scale £13,575 - £14,736 inclusive of London Allowance

This is a newly created post in the School of Biological and Health Sciences responsible for providing a state-of-the-art service and contributing to the development of improved methods in experimental biochemistry, gene manipulation and molecular biology. Applicants should have a degree or equivalent qualification and relevant experience.

Please telephone 01-580 2020 ext 2136 (answerphone) for an application form and further details or write to Personnel Department, PCL, 309 Regent Street, London W1R 8AL quoting Ref 10402. Closing date for the receipt of completed application forms is 24 April 1989.

PCL is an Equal  
Opportunities  
Employer.

## INSTITUTE OF PSYCHIATRY DEPARTMENT OF NEUROLOGY POST DOCTORAL RESEARCH ASSISTANT

Applications are invited for a Research Assistant to study the role of monoamines in ischaemic and excitotoxic brain damage. The post is funded by the MRC for 3 years. The project involves microdialysis in vivo with HPLC analysis of amino acids and monoamines, and histological analysis of outcome. Candidates with relevant experience should contact Prof B Meldrum on 01 703 5411 (ext 3398, 3399).

Starting salary on the 1A scale up to £11680 pa plus £1650 London Allowance.

Applications in the form of a curriculum vitae and the names of two referees should be sent to the **Assistant Secretary, Institute of Psychiatry, De Crespigny Park, Denmark Hill, London SE5 8AF** quoting reference BM.

Closing date: 28th April 1989.

(8971)A

**UNIVERSITY OF NOTTINGHAM**  
**School of Agriculture**  
**Department of Physiology and Environmental Science**

**RESEARCH TECHNICIAN GRADE 3**

Applications are invited from suitably qualified candidates to work on a project financed by Agricultural Genetics Company of Cambridge on biological control of plant diseases using bacterial inoculations. A qualification in microbiology is necessary and experience in fermentation technology would be an advantage.

Commencing as soon as possible this post will be offered initially for a period of 12 months. Salary on a scale £6,636 to £6,871 according to age, qualifications and previous experience. Minimum qualification ONC, TEC or equivalent.

Application forms obtainable from the Administrative Assistant, University of Nottingham, School of Agriculture, Sutton Bonington, Nr Loughborough, Leics LE12 5RD. Telephone Nottingham 484848 Ext 8302. Please quote Post Ref. 89/08. (8953)A

**POSTDOCTORAL POSITION: Neurobiology of Disease**

The Department of Pathology at U.W.O. invites applications from individuals interested in neurobiology of disease with a background in structure and function of biological peptides, including molecular biology techniques and monoclonal antibody production. The project involves the study of a neuronal protein related to resistance to excitotoxic (epileptic) injury. This protein is abundant in neurites of plaques in Alzheimer disease.

Send curriculum vitae and names of three references to: **Dr. David Munoz, Department of Pathology, University of Western Ontario, Health Sciences Center, London, Ontario, Canada N6A 5C1** (NW3598)A

**AQUATIC TOXICOLOGIST**

World-renowned environmental testing laboratory seeks experienced aquatic toxicologist to manage a large, newly constructed commercial aquatic toxicology laboratory. Successful candidate must have doctorate or equivalent and be familiar with the design, conduct and reporting of freshwater and marine tests. Preference will be given to those with demonstrated management skills and a working familiarity with good laboratory practices. Excellent writing skills a must. Position open immediately. Excellent benefits. Salary dependent upon experience. Send résumé to: **Aquatic Programs, Wildlife International Ltd., 305 Commerce Drive, Easton, MD 21601.** (NW3584)A

**DEPARTMENT OF VETERANS AFFAIRS**

**VETERANS HEALTH SERVICES AND RESEARCH ADMINISTRATION**

**DIRECTOR MEDICAL RESEARCH SERVICE**

The Department of Veterans Affairs invites applications for the position of Director, Medical Research Service. The Medical Research Service currently has a budget of about \$200 million and supports biomedical and behavioural sciences research of over 2500 VA scientists, 70 percent of whom are physicians. It is strongly committed to support of patient-oriented research across the entire spectrum from basic science to clinical applications of new knowledge. The Director is responsible for policy development, peer review management of all investigator-initiated research studies and budget formulation and distribution. Candidates are expected to be nationally recognized scientists and they must have an established record of scholarly achievement. The position is only open to U.S. citizens who hold an M.D. degree. Salary is \$75,500 with additional special pay up to \$24,000.

Qualified applicants are invited to send a curriculum vitae, bibliography and the names, addresses and telephone numbers of three respondents by 15 May 1989 to: **Richard J. Greene, M.D., Ph.D., Assistant Chief Medical Director for Research and Development (15), Department of Veterans Affairs, 810 Vermont Avenue, N.W., Washington, D.C. 20420.**

**Veterans Administration**

(NW3541)A

**THE UNIVERSITY OF LEEDS DEPARTMENT OF PATHOLOGY PREDOCTORAL RESEARCH ASSISTANT/POSTDOCTORAL RESEARCH FELLOW**

Applications are invited for the above post available as soon as possible for a fixed period of three years for work on identification of oncogene abnormalities in cervical cancer which may be used as a screening test, involving the use of PCR, RNaseA digestion and other molecular biological techniques.

A good honours degree in biochemistry is required. Candidates with a PhD in molecular biology may be appointed as a Research Fellow on R/A IA.

Salary for Research Assistant on R/A Grade IB (£8675-£11680) or Research Fellow on Grade IA (£9865-£15720), according to qualifications and relevant experience.

Informal enquiries may be to Dr Philip Quirke or Mrs J Fearnley (tel (0532) 333399/87).

Application forms and further particulars may be obtained from and completed applications forwarded to the Registrar, the University, Leeds LS2 9JT (tel (0532) 333963 — direct line), quoting reference no. 102/40. Closing date for applications 4 May 1989. (8958)A

**RESEARCH ASSOCIATE (BIOCHEMIST)**

with 5 years of postdoctoral training to study flavonoids in cell activation and chemoprevention. Ph.D. biochemistry/enzymology training in polyphenol metabolism. Experience in cell and organelle isolation, membrane enzymes and purification/characterization, lipid peroxidation, HPLC, enzyme induction/xenobiotic metabolism, carcinogen-DNA binding, carcinogen metabolite characterization, radioisotope handling and writing grant proposals. Candidate expected to develop independent research program on flavonoids. Salary: to \$27,500. Send résumé and three reference letters to: **Director, Allergy Division, SUNY/Bufalo, Buffalo General Hospital, 100 High Street, Buffalo, NY 14203. Affirmative Action/Equal Opportunity Employer.** (3608)A

**ASSISTANT PROFESSOR**

Full-time (9-month), tenure-track position, beginning fall 1989. General and applied microbiology, and general biology for department majors. Competence in immunology is desirable. Ph.D. required. Send curriculum vitae and names and addresses of references to: **I. Gepner, Chair, Department of Biology, Monmouth College, West Long Branch, NJ 07764. Equal Opportunity Employer; women and minorities are encouraged to apply.** (NW3592)A

## HUGH KNOWLES CHAIRS AUDIOLOGY AND HEARING SCIENCE NORTHWESTERN UNIVERSITY

Northwestern University announces the establishment of two endowed chairs, the **Hugh Knowles Chair in Audiology** and the **Hugh Knowles Chair in Hearing Science**. Each Chair, funded by a generous gift from Knowles Electronics, Inc., will be filled by faculty of distinguished scholarly achievement or unusual promise and developing international reputation. Applicants for the Audiology Chair should be Ph.D. scholars with an interest in auditory system function, having quantitative background (e.g., bioengineering, computer science or psychoacoustics). Applicants for the Hearing Science Chair should be Ph.D. or M.D. scholars with accomplishments in basic or clinical neuroscience and an interest in either higher nervous system function or neurobiology of the peripheral auditory system. These positions will be filled at either the full or associate professor level. Generous start-up funds, laboratory space and a competitive salary are provided.

Applications and nominations are invited. Review of applications will begin immediately, but these positions will remain available until filled. Please send curriculum vitae along with a letter of interest to:

**Chair, Search Committee  
Audiology and Hearing Impairment Program  
Northwestern University  
2299 Sheridan Road  
Evanston, IL 60208**

Northwestern University is an EO/AA Employer. Hiring is contingent upon eligibility to work in the United States.

## ASSISTANT PROFESSOR POSITIONS CELLULAR NEUROBIOLOGY AND SYSTEMS NEUROBIOLOGY DEPARTMENT OF PSYCHOBIOLOGY UNIVERSITY OF CALIFORNIA, IRVINE

Applications are invited for two tenure-track positions at the level of assistant professor in cellular neurobiology and systems neurobiology. Preference will be given to applicants who have demonstrated expertise in research areas of interest to the Department. The Department of Psychobiology emphasizes interdisciplinary approaches to the study of neural plasticity and behavior. The current major research themes of the Department are development, reorganisation following injury and disease, and learning and memory. Please submit by 15 August 1989, curriculum vitae, description of research interests, and three confidential letters of recommendation to: **Chair, Department of Psychobiology, University of California, Irvine, CA 92717.**

UCI is an Affirmative Action/Equal Opportunity Employer

(NW3607)A

## RESEARCH ASSOCIATE/ASSISTANT PROFESSOR

A non-tenure track position for a Research Associate/Assistant Professor is available for research and teaching, with limited participation in selected course offerings. The research area is to be directed towards the molecular/cell biology of microtubules and associated proteins and their structural-functional correlation, using a broad range of techniques, including protein purification/characterization, hybridoma technology, immunochemistry and immunomicroscopy. A Ph.D or foreign equivalent and two years of postdoctoral experience are required. The position will be filled on the basis of demonstrated research experience.

Send curriculum vitae and three letters of reference by May 15, 1989 to: **Becca Vance, Department of Cell Biology & Neuroanatomy, University of Minnesota, 4-135 Jackson Hall, 321 Church St. S.E., Minneapolis, MN 55455.**

*The University of Minnesota is an equal opportunity educator and employer and specifically encourages applications from women and minorities.*

## Cancer Research Campaign

**Christie Hospital and Holt Radium Institute**

**PATERSON INSTITUTE FOR CANCER RESEARCH**

**Department of Carcinogenesis**

### POSTDOCTORAL SCIENTIST

Available immediately in an active group investigating the molecular basis of the biological effects of xenobiotic agents, principally environmental carcinogens and chemotherapeutic alkylating agents.

The successful candidate would mainly be involved in the isolation and expression of pro- and eukaryotic DNA repair genes. Experience in cell biology/recombinant DNA methodology, especially gene cloning and transfer techniques would be an advantage. Informal enquiries to Dr Geoff Margison, 061 445 8123 ext 413.

The post is available for 5 years initially under MRC conditions of employment and remuneration, depending upon age and experience.

**Please send CV and an outline of research interests and the names of 2 academic referees to Dr P J O'Connor, Head, Carcinogenesis Department, Paterson Institute for Cancer Research, Christie Hospital and Holt Radium Institute, Manchester, M20 9BX, UK. (8983)A**

## THE AUSTRALIAN NATIONAL UNIVERSITY

**CENTRE FOR INFORMATION  
SCIENCE RESEARCH**

### POSTDOCTORAL FELLOW/ RESEARCH FELLOW

**(COMPUTATION USING  
NEURONAL NETWORKS)**

A position is available for an applicant with a PhD in engineering or science to investigate the use of self-organising neuronal-like networks to 1) extract features from poorly defined data, and 2) assist in understanding the integrative action of real nervous systems. Applicants should have a strong background in mathematics and computation and an enthusiasm for investigating uses of parallel processing with adjustable connectivity. No detailed knowledge of the nervous system is required. The successful applicant will work with Professor S. Redman in the Experimental Neurology Group, Division of Neuroscience, John Curtin School of Medical Research. Enquiries to Professor Redman: (062) 492602.

Closing date: 9 June 1989. Ref: IS 30.3.1.

**SALARY:** Research Fellow; A\$30,737-A\$40,100 p.a.; Post-doctoral Fellow Grade 1 (fixed point); A\$26,617-A\$30,360 p.a. **APPOINTMENT:** Research Fellow up to three years, possibility of extension to five years; Postdoctoral Fellow normally two years, possibility of extension to three years. **APPLICATIONS** should be submitted, in duplicate to the Registrar, The Australian National University, GPO Box 4, Canberra ACT 2601, Australia, quoting reference number and including curriculum vitae, list of publications and names of at least three referees. The University reserves the right not to make an appointment or to appoint by invitation at any time. Further information is available from the Registrar, or from Appointments (36238), Association of Commonwealth Universities, 36 Gordon Square, London WC1H 0PF.

**THE UNIVERSITY IS AN  
EQUAL OPPORTUNITY EMPLOYER** (W6045)A

## UNIVERSITY OF BIRMINGHAM CANCER RESEARCH CAMPAIGN LABORATORIES

A post-doctoral Research Fellow required to join a collaborative project studying the structure and function of the *ras* p21 oncogene product. Protein biochemistry and nuclear magnetic resonance (NMR) investigations are underway into the mode of action of p21 and it is envisaged that the successful applicant will be able to contribute expertise in protein chemistry and/or molecular biology, cell biology or related areas of knowledge are invited to apply. Knowledge of NMR is not required. Post is for three years funded by the Cancer Research Campaign and is available immediately. Salary will be on scale £9865 - £15720 with superannuation.

Informal enquiries to Dr. Roger Grand 021-414-4481. Application forms and further particulars available from **Senior Assistant Registrar, Medical School, Birmingham, B15 2TJ, 021-414-4050 to whom applications (3 copies) should be sent by 28th April. Quote Ref. RF/CS/RG.**

**AN EQUAL OPPORTUNITIES EMPLOYER** (8949)A

## PLANT BREEDING INTERNATIONAL WHEAT BREEDERS

PBI Cambridge was established in 1988 as a Unilever Company following the acquisition, from the UK government, of the facilities and major breeding programmes of the former Plant Breeding Institute, and the National Seed Development Organisation. The wheat breeding programme has an established record of excellence and PBI varieties occupy 70% of the UK acreage.

We are now seeking to appoint additional wheat breeders to strengthen the programme and extend it into Europe. The expansion is beginning with the establishment of a programme in France.

Applicants should have a good honours degree in plant science. Relevant postgraduate experience would be a distinct advantage. However, consideration will also be given to those who can demonstrate a commitment to plant breeding.

Salary will be negotiable depending on experience and qualifications.

For further particulars and application form, telephone Cambridge 840411 ext 307, or write to the **Personnel Officer, Plant Breeding International Cambridge Ltd, Maris Lane, Trumpington, Cambridge CB2 2LQ**, quoting ref WT/57.

An Equal Opportunities Employer.

PLANT BREEDING INTERNATIONAL

## MEDICAL RESEARCH COUNCIL TOXICOLOGY UNIT

### RESEARCH OFFICER

Required to work in a Toxicology Laboratory, investigating cell specific mechanisms of toxicity in the kidney. The position would suit a biochemist with cell culture and separation expertise. Experience in immunology and immunocytochemistry would be an advantage.

Applicants should hold a Degree or equivalent qualification in a biological science. Salary is on an incremental scale £7,443-£13,545 including London Weighting. (Pay award pending.)

For further details and application form, please contact **Dr K. Cain, Toxicology Unit, MRC Laboratories, Woodmansterne Road, Carshalton, Surrey SM5 4EF**. Tel 01-643 8000.

Closing date for application is 11th May 1989.

The Council is an Equal Opportunity Employer.

(9010)A

## POSTDOCTORAL POSITION

available immediately for a biophysical chemist to study cation-DNA interactions by multinuclear NMR. Send résumé and two letters of reference to **Dr. W. Braunlin, Polytechnic University, 333 Jay Street, Brooklyn, NY 11201**. Telephone 718-260-3552.

**nature**

Still first with the best  
in science

## CEREBROVASCULAR RESEARCH SCIENTIST

to join existing faculty in the study of the development, plasticity and pathology of neurovascular function. The successful candidate will exhibit evidence of independent research productivity and the ability to attract external funding. Applicants should have experience with pharmacological, physiological and functional methods to complement present anatomical, biochemical and immunohistochemical techniques. Primary tenure-track appointment will be in the Department of Neurosurgery at the assistant or associate professor level. Please send C.V. and have three letters of recommendation forwarded to **Keith A. Crutcher, Ph.D., Research Division, Dept. of Neurosurgery, Univ. of Cincinnati, Cincinnati, OH 45267**.

(NW3604)A

*The Polytechnic operates a range of degree and post graduate level courses, has a vigorous and successful record of consultancy and research. Due to Corporate Status the Polytechnic has entered a new and challenging phase of its development. To maintain and extend the programme of work, applicants are invited for the following post:-*

## FACULTY OF SCIENCE – SCHOOL OF PHARMACOLOGY

### Head of School

£24,084 – £26,538

Applicants for the post should possess high academic credibility and also have the ability to manage the School as a budget centre, be able to lead in academic development and entrepreneurial initiatives. The person appointed would be eligible for consideration for appointment to the Professoriate.

The School of Pharmacology is one of 3 schools in the Faculty of Science and has an establishment of 16 academic staff. The School embraces the disciplines of pharmacology and physiology.

**Applications forms and further particulars can be obtained from Personnel Services, Sunderland Polytechnic, Langham Tower, Ryhope Road, Sunderland SR2 7EE, or telephone 091 5152429.**  
Closing date: 5th May, 1989.

**SUNDERLAND  
POLYTECHNIC**

## ROYAL POSTGRADUATE MEDICAL SCHOOL (University of London)

### DEPARTMENT OF MEDICINE — ENDOCRINE UNIT NON-CLINICAL LECTURER

Applications are invited for a lectureship in the Endocrine Unit of the Department of Medicine, Royal Postgraduate Medical School. This is a busy laboratory of about 20 scientists working in the field of regulatory peptides. Particular interests include the expression, role and pathophysiology of novel peptides in the hypothalamus, pituitary and islets of Langerhans. The successful applicant will have a PhD and be expected to contribute collaboratively to the original research of the unit. The candidate's own field of expertise and current interest is not critical. The post is for 5 years. Initial salary will be at an appropriate point on the salary scale for non-clinical Lecturers (A or B). Informal enquiries to Professor S R Bloom on 01-740 3242.

Applications in the form of a c.v. (Six copies) with the names and addresses of 3 referees should be sent to the **Personnel Officer, Royal Postgraduate Medical School, Du Cane Road, London W12 0NN**, from whom further particulars are available (telephone 01-740 3204). The closing date for the receipt of applications is 11 May 1989. Ref: AM88

(9002)A

## RESEARCH ASSOCIATE (POSTDOCTORAL)

available immediately to study the neuronal mechanisms underlying the behavioral effects of hallucinogens, CNS stimulants and related compounds. The applicant should have a Ph.D. (or ABD) in experimental psychology, pharmacology or related biomedical science, knowledge of drug discrimination methods, and an interest in more "molecular" techniques (neurotoxin lesion, in vivo dialysis, etc.) in conjunction with this procedure. Expertise in computer programming and interfacing is desirable but not mandatory. Send curriculum vitae and three letters of reference to: **James B. Appel, Ph.D., Behavioral Pharmacology Laboratory, Department of Psychology, University of South Carolina, Columbia, SC 29208**. The University of South Carolina is an Equal Opportunity/Affirmative Action Employer.

(NW3603)A

## Inflammation, Osteoarthritis, Enzymology Research

### Team Leaders

CIBA-GEIGY Pharmaceuticals, an industry leader in inflammation research and therapy, offers outstanding career opportunities for innovative scientists interested in Inflammation, Osteoarthritis, and Enzymology.

#### Director, Inflammation Pharmacology

Lead a team of 15 Immunopharmacologists and Cell Biologists to discover anti-inflammatory agents and agents to treat autoimmune diseases and osteoarthritis. A PhD in Pharmacology, Immunology, or Biochemistry plus 8-10 years of postgraduate research in immunopharmacology is required; extensive background in humoral and cellular immunology is essential. Please respond to Dept 357.

#### Director, Enzymology and Molecular Biology

Lead a team of 20 Enzymologists and Molecular Biologists to discover agents to treat osteoarthritis, and inflammatory and cardiovascular diseases. A PhD in Biochemistry, Molecular Biology or Pharmacology plus 8-10 years of postgraduate experience in enzymology and/or molecular biology with emphasis on inflammation or cardiovascular research is required. Please respond to Dept 343.

#### Manager, Osteoarthritis Research

Lead a team of 12 Pharmacologists to develop and evaluate in vivo models of osteoarthritis, rheumatoid arthritis and other inflammatory diseases. A PhD in pharmacology with at least 5 years of postgraduate experience in the pharmaceutical industry studying inflammatory diseases is required. Please respond to Dept 355.

**These positions further require experience in initiating and implementing drug discovery projects, the ability to lead multidisciplinary research teams, and excellent communication skills.**

We offer excellent salaries and benefits, plus a high level of professional visibility and career potential. Reply in confidence, by sending your resume and salary history, indicating department code to: **CIBA-GEIGY Corporation, Pharmaceuticals Division, 556 Morris Avenue, Summit, New Jersey 07901.** We Are An Equal Opportunity Employer M/F/H/V.

### GROUP LEADER POSITION FOR CELL BIOLOGY

in the Section of Cell Biology and Genetics

The group will include in addition to the advertised position two scientists and three technicians and excellent research conditions in a new laboratory. The successful applicant will have a background in cell biology, immune biology, inflammation or bone cell differentiation and several years' post-doctoral experience. An appreciation for the possibilities of cooperation and interaction with other departments is expected.

Applications should be addressed (within six weeks of the appearance of this advertisement) to the **Personnel Dept., GBF, Mascheroder Weg 1, D-3300 Braunschweig, FRG (ref. no. 48/89).** Please include a complete c.v., list of publications, details of research activities to date. Further information can be obtained from the Section Head, Prof. Dr. John Collins (Tel. 531/6181-200). (W6050)A

## Ph.D.'s

Biotech Research Labs in Rockville, has openings for 2 Ph.D.'s.

**HIV RESEARCH:** Individual will be responsible for HIV research. We are looking for an individual who enjoys a challenge to help solve the mysteries of HIV.

**MOLECULAR BIOLOGIST:** Individual must have experience with recombinant DNA techniques. Familiarity with characterization of genomic DNA in construction of expression vectors is preferred.

We offer competitive salaries and an excellent benefits package. If interested, please submit a CV to:

# PFIZER ACADEMIC TRAVEL AWARDS

Pfizer Central Research at Sandwich, Kent plan to institute a new Travel Award Scheme to assist selected academic staff at British Universities, or equivalent institutions, to attend national or international symposia relevant to their field of research. Up to ten Awards will be made annually by Pfizer, on the basis of academic research achievement and with a bias towards younger applicants.

The Awards will each be up to £500 in value. Five will be allotted to academic staff in U.K. departments of Organic Chemistry and five to departments of Biological Sciences.

Application forms can be obtained by writing to Dr. P. R. Leeming, Pfizer Central Research, Sandwich, Kent CT13 9NJ. The closing date for application

for 1989-1990 Awards is 31st May and will be available for symposia commencing 1st July, 1989-30th June, 1990.

These travel Awards are the latest in a series of initiatives taken by Pfizer to support academic research in the U.K., and in particular to help young scientists early in their careers.

Pfizer is a worldwide, research-based company with businesses in health care, agricultural, specialty chemicals, materials science and consumer products. The Company has a major commitment at Sandwich where it employs approximately 1,700 people, of whom nearly 700 are engaged in new product research.

## PEARSE PRIZE AND LECTURESHIP

To honour the contributions made to histochemistry by Professor A.G.E. Pearse a prize was established which is administered by the Royal Microscopical Society. The prize should be seen to be one of the major international honours in Histochemistry and will be awarded approximately every two years. It is envisaged that it will be given to a scientist who has contributed significantly to Histochemistry and is still active.

Nominations are now called for the 1990 PEARSE PRIZE to be awarded to a scientist who has made a valuable contribution either

- (a) to the development of histochemical techniques
- or (b) to the application of histochemical methods.

The name of each candidate should be accompanied by

- 1) a letter of recommendation containing a statement of reasons for the nomination, signed by two people who are familiar with the candidate's work,
- 2) a list of publications of the candidate,
- 3) the written consent of the candidate.

The Prize winner will receive a medal and be invited to deliver a lecture to the Royal Microscopical Society.

Nominations should be sent to the **Pearse Prize Committee, Royal Microscopical Society, 37/38 St. Clements, Oxford OX4 1AJ, U.K.** to be received by 30th November 1989. (8993)N

## FELLOWSHIPS

### MARINE BIOLOGICAL ASSOCIATION OF THE UNITED KINGDOM

#### FELLOWSHIP IN MOLECULAR BIOLOGY

The Council of the Association wishes to promote the application of molecular biological techniques to fundamental problems that can be best approached by exploiting the diverse range of species available in the sea. We are particularly interested in problems associated with the evolution of the vertebrates and embryonic development.

Applications are therefore invited for a five year post-doctoral Fellowship, to be held at the Association's Laboratory in Plymouth where there are good facilities for catching and maintaining a wide variety of marine species. The successful candidate will be encouraged to spend some time in the laboratory of Dr S Brenner (MRC Laboratory of Molecular Biology, Cambridge) acquiring the appropriate techniques. MBA Fellows are also encouraged to have direct links with University Departments.

The MBA Laboratory is housed at Citadel Hill together with components of the Plymouth Marine Laboratory (PML) of NERC and relevant research underway includes the molecular aspects of the response of marine organisms to environmental stimuli, cell signalling mechanisms during development, and the molecular genetics of *Sagitta*. There is also an active Visitors Programme with a strong emphasis on cephalopod neurobiology and molecular and physiological aspects of the development of *Ciona*. We are particularly interested in applicants whose project can relate to this on-going work.

Application should be made to **Dr M Whitfield, Director, Marine Biological Association, Citadel Hill, Plymouth, PL1 2PB**, from whom further information on the Association's Research Programme may be obtained. Applicants should include a statement indicating their proposed area of research, a CV and the names of three referees. The closing date for applications is 30 May 1989. Salary will be assessed by analogy with Civil Service scientific scales according to age, qualifications and experience. The starting date will be by arrangement. (8950)E

# WOOD/WHELAN INTERNATIONAL UNION OF BIOCHEMISTRY (IUB) AND INTERNATIONAL COUNCIL OF SCIENTIFIC UNIONS (ICSU) RESEARCH FELLOWSHIPS

## Objectives

The Wood/Whelan IUB and ICSU Research Fellowship are designed to support biochemists who need to travel to other laboratories in the IUB/ICSU areas for the purpose of carrying out experiments requiring special techniques or for other forms of scientific collaboration or advanced training.

## Conditions of the Fellowships

The fellowships will be awarded for short periods (2 weeks to 2 months, exceptionally 3 months). The fellowships will cover travel costs on the basis of economy or tourist fares (coverage will only be partial for long distances). A basic subsistence allowance of US\$25/day will be allotted to fellowship holders, with a geographical adaption factor. There will be no additional stipend for dependents and no provisions made for accidental or health insurance, which are expected to be contracted privately by the fellows.

Recipients of the fellowships are required to make a full declaration to IUB/ICSU of all other support received towards the same travel and subsistence. IUB/ICSU may reduce its financial contribution accordingly. IUB/ICSU fellowships cannot be used to supplement other full time support fellowships.

## Applications

Applications should be sent in triplicate with the following documents:

- A research proposal of about two pages typescript indicating clearly: (1) the nature of the project and the type of experiments to be carried out; (2) why it is necessary to travel to another laboratory to conduct the experiments rather than to perform them in the applicant's own laboratory or simply ship the materials; (3) why the particular laboratory has been selected; (4) why the project will require the particular time period requested. If the aforementioned material is not sufficiently clear, the application is likely to be rejected or the decision on it seriously delayed.
- A short curriculum vitae of the applicant with a list of publications indicating names and other authors
- A letter of acceptance from the head of the receiving institute and signed by the leader of the group which will receive the recipient.
- A letter of recommendation from the head of the department of the applicant's institution indicating support of the applicant and the reasons why the fellowship would be beneficial. This letter should also list all other fellowships previously received by the applicant, especially for travel abroad to attend meetings or study at another institution.

**Applications from Africa, Europe or North America should be sent to Dr. Marianne Grunberg-Manago, Institut de Biologie Physico-Chimique, Fondation Edmond de Rothschild, 13, rue Pierre et Marie Curie, 75005 Paris, France.**

**Applications from Latin America or Asia should be sent to Dr. Jorge E. Allende, Departamento de Bioquímica, Facultad de Medicina (Norte), Universidad de Chile, Casilla 6671, Santiago 7, Chile.**

Applications can be submitted at any time but they will be reviewed twice each year, in June and December.

## Criteria for Selection of Fellows

The criteria for the selection of applicants are:

- Excellence of qualifications of the applicant.
- Need to travel to do the experiments and availability of other sources of funds to finance travel. Only exceptionally will support be given to senior scientists or to heads of departments. Fellowships will not be awarded to attend courses, symposia, meetings or congresses.
- Geographical distribution.

## Postdoctoral Fellowships in Molecular Biology/ Mammalian Development

Positions are available in the Department of Dermatology and Oncology for postdoctoral fellows to study the effects of retinoids on mammalian embryonic development using molecular biological approaches. Experience in one or more of the following areas is desirable: embryology, cell biology, or molecular biology.

The positions will be initially for one year, with extensions foreseen for an additional year.

Interested individuals are invited to send a copy of their c.v., including a list of publications, and letters from three referees to the **Personnel Department**, quoting reference Nature 73/89/WA.

Fulham Road, London

## POSTDOCTORAL FELLOWSHIP

A postdoctoral fellowship is available for a molecular biologist/biochemist to join a research team (lead by Dr. G. Goodwin) within the Department of Cell and Molecular Biology at the Chester Beatty Laboratories. The project is concerned with the molecular cloning of three transcription factors which we have identified binding to regulatory elements of the c-myc proto-oncogene.

Experience of molecular biology techniques is desirable.

The position is funded for three years and salary is in the range of £13130 to £15950 inclusive.

Informal enquiries can be made by contacting Dr. G. Goodwin on (01) 352 8133.

Applicants are advised that smoking is prohibited in the majority of the Institute's premises.

Please send applications in duplicate with names and addresses of two referees to the **Personnel Officer**, 17A Onslow Gardens, London SW7 3AL quoting reference 4.89.S.N.2 (8954)E

## Skin Cancer Research Post Doctoral Fellowship University of Alberta

Two positions immediately available to study UV-photo-carcinogenesis and immunobiology of malignant melanoma. The amount awarded will be equivalent to MRC and NRC guidelines, with future opportunities to apply for independent research and faculty positions.

Send a resume and three references to: **Kowichi Jimbow, M.D., Ph.D., Professor and Director, Division of Dermatology and Cutaneous Sciences, 418 Newton Research Building, University of Alberta, Edmonton, Alberta, Canada T6G 2C2.**

**DEPARTMENT OF MICROBIOLOGY**

**MRC RESEARCH STUDENTSHIP**

Applications are invited for an MRC Research Studentship tenable for 3 years, commencing October 1989, to work towards a Ph.D. degree with Dr. M. J. C. Crabbe on novel antibiotic and antiviral compounds. The project will focus on molecular enzymology and molecular modelling of biosynthetic intermediates and enzymes. It will involve the use of techniques in protein chemistry, computer modelling and recombinant DNA. There will be ample opportunity for interactions with research groups in the Departments of Microbiology and Chemistry. Candidates should have, or expect to obtain, a first or upper second class honours degree in the biochemical- or chemical-related sciences.

Applications, including a CV and the names and addresses of two referees, should be sent to **Dr. M. J. C. Crabbe, Reader in Microbiology, London Road, Reading RG1 5AQ (Tel: 0734 318894; FAX: 0734 750140; Email: SKSCRABB@UK.AC.RDG.AM.CMS)**, from whom further details may be obtained.

(8989)F

**UNIVERSITY OF ABERDEEN**

**Department of Genetics and Microbiology**

**NERC Research Studentships**

are available on the following topics:

The role of soil animals in microbial dispersal, survival, growth and gene transfer (with Depts. of Biochemistry and Plant & Soil Science and NERC ITE, Merlewood).

Gene transfer in biofilms (with Dept. of Biochemistry)

Urease production and autotrophic nitrification in acid soils  
Zoospore taxis and the electrochemical nature of the rhizosphere  
Chitin deacetylation — ecological and biotechnological significance

Studentships will also be available in the following areas:

Molecular biology of membrane transport systems  
Thermophilic sulphate reducing bacteria  
Site directed mutagenesis  
Genetics of ovarian cancer.

Applications should be sent as soon as possible to **Professor W. A. Hamilton, Department of Genetics and Microbiology, University of Aberdeen, Marischal College, Aberdeen AB9 1AS. (Tel. 0224 273144).**

(8979)F

**OXFORD UNIVERSITY**

**Nuffield Department of Surgery**

**RESEARCH STUDENTSHIP**

Applications are invited for an MRC Research Studentship leading to the degree of DPhil under the supervision of one of the following: Dr. J. Austyn (maturation and migration of dendritic leucocytes); Dr. M. Dallman (the role of lymphokines in graft rejection); Dr. S. V. Fuggle (in situ hybridisation of molecules involved in cellular interactions); Dr. D. R. Gray (pancreatic islet purification by cell sorting); and Dr. K. J. Wood (mapping of active amino acids involved in the induction of allogenic unresponsiveness).

The studentship is tenable for 3 years from October 1989. Applicants should have, or expect to obtain, a First or Upper Second Class Honours degree in one of the Biological Sciences.

Applications, including a CV and the names and addresses of two academic referees should be sent to **Professor P. J. Morris, Nuffield Department of Surgery, University of Oxford, John Radcliffe Hospital, Oxford OX3 9DU by May 15th, 1989.** (8943)F

DEPARTMENT OF ZOOLOGY  
UNIVERSITY OF ABERDEEN

## PhD RESEARCH STUDENTSHIPS

### 4 awards from SERC and 4 awards from NERC

Applications are invited from undergraduates who expect to graduate this year or from students already graduated with a good honours degree in the appropriate subject for the following vacancies.

**SERC** (Quota and CASE) to be selected from:

- 1 Invertebrate neuroendocrinology (Prof Mordue)
- 2 Arthropod neurophysiology — interneurons (Dr Fraser)
- 3 Olfactory communication in mammals (Dr Gorman)
- 4 Animal nutrition, energetics and growth (Dr Houlihan)
- 5 Fish immunology (Dr Secombes)
- 6 Insect-plant relationships: the role of plant secondary compounds (Dr Mordue)
- 7 Parasite chemotherapy and reproductive biology (Dr Chappell)
- 8 Energetics of predatory fish (Dr Friede)

**NERC:**

- 1 Pheromones in wood ant foraging (Drs Ollason & Young)
- 2 Land use and herbivore feeding strategies (Professor Racey, CASE with Macaulay Institute and Forestry Commission)
- 3 Parasite infection strategies in fish and molluscs (Dr Chappell)
- 4 Effects of omnivores and parasites on food webs (Drs Raffaelli & Pike)

Applicants should write to the Head of Department or make direct contact with the staff member concerned.

Address: **Department of Zoology, University of Aberdeen, Tillydrone Avenue, ABERDEEN, AB9 2TN**

## UNIVERSITY OF LEEDS

### DEPARTMENT OF BIOPHYSICS

#### SERC MOLECULAR RECOGNITION CENTRE RESEARCH STUDENTSHIPS 1989

for graduates in Chemistry, Physics, Biochemistry, Biophysics or Computer Science.

Several SERC and MRC Research Studentships are available for projects including the following topics:

Copper quinoproteins: sequencing and mutagenesis of the galactose oxidase gene.  
Structural studies of bacterial Arg and Met repressors and their interactions with synthetic operators.

Structural studies on the mechanism of inhibitors of dihydrofolate reductase.

Modelling the tar stem-loop region of the RNA of human immunodeficiency virus (the "Aids" virus).

Ligand-binding and stabilization of beta-lactoglobulin.

(CASE Studentship with Hannah Research Institute)

X-ray and optical microscope studies of liquid crystalline phases of anti-asthmatic and anti-allergic drugs, dyes and nucleic acids.

Synthesis and structural studies of sulphated carbohydrates.

(CASE Studentship with AFRC Institute for Food Research)

The Biophysics department is excellently equipped for the study of molecular structure and functions by X-ray crystallography, computer graphics and spectroscopy; extensive collaboration with the Biochemistry, Genetics and Biotechnology groups in Leeds provides an exciting research environment.

Candidates must expect to obtain a good honours degree in a relevant subject and should apply to:

**Professor A.C.T. North, Department of Biophysics,**

**University of Leeds, Leeds LS2 9JT (telephone 0532 333022) (8978)F**

## HANNAH RESEARCH INSTITUTE

### AFRC POSTGRADUATE STUDENTSHIPS

Two AFRC studentships are available from 1st October 1989 to study:

(1) Adipogenic factors: this involves isolation, characterisation and immunological manipulation of factors which promote the development of adipose tissue in farm animals, and is supervised by Drs Vernon, Flint and Clegg.

(2) Autocrine mechanisms

modulating endocrine control of mammary gland function: this involves investigation of the control of receptors for hormones and growth factors in the mammary gland by local mechanisms sensitive to milking frequency or efficiency, and is supervised by Dr Wilde.

Further information can be obtained by contacting the supervisors (telephone 0292 76013). Letters of application accompanied by a CV (including names and addresses of two academic referees) should be sent to: The Secretary, Hannah Research Institute, Ayr, KA6 5HL. (8975)F

## THE UNIVERSITY OF NEWCASTLE UPON TYNE GENETICS

### SERC RESEARCH STUDENTSHIPS 1989

Two SERC studentships are available within the Department starting on 1 October 1989, to work on (1). Cryoenzymology of Penicillin acylase from *Escherichia coli*, and (2). Domain structure and function with the pentafunctional AROM polypeptide of *Aspergillus nidulans*. The projects will involve low temperature solution techniques to study catalytic mechanisms and intermediates, and the use of the powerful techniques of molecular biology to isolate and characterise functional protein domains and synthesise proteins with unique enzymatic properties.

Candidates should have or expect to obtain a 2(i) degree (or equivalent) in a relevant subject, and are encouraged to phone Richard Virden (091-2227432) or Alastair Hawkins (091-2227673) to discuss the projects in more detail. Applications should contain a full curriculum vitae and the names and addresses of two academic referees and be sent to the **Department of Biochemistry and Genetics for the attention of Dr. Richard Virden (project 1) or Dr. Alastair Hawkins (project 2) as soon as possible.** (8991)F

## UNIVERSITY OF BIRMINGHAM DEPARTMENT OF IMMUNOLOGY

### Ph.D Research Studentship

Applications are invited from candidates wishing to pursue a full-time three-year Ph.D programme of investigation into biochemical and biological aspects of B lymphocyte derived growth factors. This is an MRC funded project which will be under the supervision of Dr John Gordon and his team, with the work being carried out in a multi-disciplinary environment.

Written applications including a C.V. and the names and addresses of two referees should be sent as soon as possible to **Dr John Gordon, Department of Immunology, West Extension, The Medical School, Vincent Drive, Edgbaston, Birmingham, B15 2TJ.**

Informal enquiries to Dr Gordon (021.414.4034).

(8969)F

## UNIVERSITY OF SOUTHAMPTON CLINICAL PHARMACOLOGY GROUP AND MEDICINE RESEARCH STUDENTSHIP

Applications are invited for a three year research studentship to commence in October 1989 researching into inflammatory factors causing human gastrointestinal diseases and drugs used in their treatment. The Group has excellent equipment and well funded projects. The student will receive broad training suitable for an industrial or academic career in a unit committed to high quality collaborative research. The University and surrounding area have excellent recreational facilities.

Applicants should hold or expect to obtain a good degree in the biological sciences.

Please send a full curriculum vitae and the names and addresses of two referees as soon as possible to **Dr K. Hillier, Clinical Pharmacology Group, Medical & Biological Sciences Building, Bassett Crescent East, Southampton SO9 3TU,** from whom further details can be obtained by telephoning 0703-595000, ext. 4264, or writing.

(8922)F

## FELLOWSHIPS CONTINUED FROM PAGE 21

### University of Western Ontario

#### Post Doctoral Fellowship in Applied Mathematics

Applications are invited from candidates possessing a Ph.D. in a suitable branch of pure or applied mathematics to carry out research on integral transforms occurring in wave propagation problems. Stipend \$1650-\$1950 per month.

Applications naming two referees should be sent to **Dr. D. Naylor, Department of Applied Mathematics, University of Western Ontario, London, Canada, N6A 5B9** (NW3597)E

## STUDENTSHIPS

### UNIVERSITY OF OXFORD

#### NEUROSCIENCES GROUP INSTITUTE OF MOLECULAR MEDICINE JOHN RADCLIFFE HOSPITAL

Applications for the following posts are invited from final year students expecting to get a good honours degree, to work in a multi-disciplinary research group studying the human autoimmune disease myasthenia gravis.

#### MRC RESEARCH STUDENTSHIPS

£3,125 per annum (allowances available for mature students and for those with previous experience) for a period of three years.

The student would work on one of the following projects:

- (1) Eukaryotic expression of human acetylcholine receptor
- (2) Presentation of recombinant human acetylcholine receptor to human T cell clones
- (3) Expression of acetylcholine receptor epitopes and mRNA in human thymus and thymoma

#### RESEARCH ASSISTANT — Grade 1B

Salary: £8,675-£13,265.

To investigate the effects of myasthenic antibodies on ion channels expressed by neuronal cell lines, using voltage/patch clamp recording techniques. This post is funded by Action Research for a period of three years.

Applications, including a cv and the names of two referees, should be sent to **Professor J. Newsom-Davis, Neurosciences Group, Institute of Molecular Medicine, John Radcliffe Hospital, Oxford OX3 9DU**. Further details can be obtained by telephoning (0865) 752322. (9004)F

*The University is an Equal Opportunity Employer*

#### UNIVERSITY OF BRISTOL SCHOOL OF CHEMISTRY ORGANIC GEOCHEMISTRY UNIT NERC RESEARCH STUDENTSHIPS

Opportunities exist for research leading towards a Ph.D. degree in the following areas:-

1. **Bacterially mediated sulphur incorporation into organic matter in marine sediments** (CASE award with the Scottish Marine Biological Association, Oban). Recent studies have revealed the presence of novel sulphur containing lipids in marine sediments. The student will investigate the pathways to, and rates of production of, such lipids, using a combination of modern chemical and microbiological methods.
2. **Biomarkers of bloom forming marine phytoplankton** (CASE award with the Scottish Marine Biological Association, Oban). Studies of the biolipid distributions of natural blooms, and cultured samples grown and biodegraded under a variety of conditions, will be used to interpret the sedimentary record.
3. **Biogeochemistry of diagenetic fronts in deep sea sediments** (CASE award with the Institute of Oceanographic Sciences, Deacon Laboratory). Sedimentary cores taken from the Atlantic show evidence of postdepositional microbial 'burn down'. The student will be part of a team investigating the associated molecular (lipid) changes with a view to better interpretation of the geological record.
4. **Chitin in the fossil record**. Chitin is a complex polysaccharide found in a range of organisms which are primary contributors of animal organic matter to sediments. The project will investigate the influence of environmental parameters on chitin degradation by sediment bacteria, including the analysis of the degradation products, and will involve field work on exceptionally preserved fossil occurrences.

Applicants should have, or expect to obtain, a good Honours Degree in Chemistry or Biochemistry (1-4), Microbiology (1,4), or Earth Sciences with a component from one of these fields (4). **Applications to Dr. J.R. Maxwell (1), Professor G. Eglinton (2-4), Organic Geochemistry Unit, University of Bristol, School of Chemistry, Cantock's Close, Bristol BS8 1TS.** (8996)F

#### IMPERIAL COLLEGE OF SCIENCE, TECHNOLOGY & MEDICINE DEPARTMENT OF PURE & APPLIED BIOLOGY POSTGRADUATE STUDENTSHIPS

Studentships are available in the Department of Pure and Applied Biology. Applications will be welcomed for the following projects:

- |   |   |
|---|---|
| <p>(a) Immuno-epidemiology of gastro intestinal nematode infections.</p> <p>(c) Behaviour of aphids in relation to virus transmission and treatment</p> <p>(e) Electrophysiological and structural studies of chitin-secreting cells.</p> <p>(g) The antigenic architecture of the liver stages of malaria: a primary analysis of novel vaccine or drug targets.</p> <p>(i) The use of transgenic plants to study geminivirus DNA replication.</p> <p>(k) Biochemical and neurophysiological studies on the selective toxicity of second generation avermectins against lepidoptera.</p> <p>(m) Population dynamics of insect-parasitic nematodes.</p> <p>(o) Mechanisms of selective herbivory in foliar and root-feeding insects.</p> <p>(p) Investigating the manganese-protein complex, using EPR and biochemical techniques.</p> <p>(r) The analysis of predation and parasitism in a field population of insects.</p> <p>(t) Interactions between foliar and root-feeding insects.</p> <p>(v) Development of an image analysis system for studying arthropod behaviour.</p> <p>(x) Signals and receptors in nematode diapause.</p> <p>(aaa) Isolation and functional importance of the products of the ndh genes of the chloroplast genome.</p> | <p>(b) Transmission dynamics of infectious diseases.</p> <p>(d) <i>In vitro</i> and <i>In vivo</i> investigation of insecticide antimicrobial drugs.</p> <p>(f) Digestive physiology of parasitic arthropods.</p> <p>(h) Molecular organisation and expression of tobacco necrosis virus.</p> <p>(j) Recombination mechanisms in fungi.</p> <p>(l) Structure-activity relationships of novel avermectins in insects.</p> <p>(n) The study of primary photochemistry of photosynthetic pigment-protein complexes using picosecond and femtosecond time time-resolved laser spectroscopy.</p> <p>(q) Effects of elevated CO<sub>2</sub> concentrations on crop/pest interactions.</p> <p>(s) The role of polyphagous parasitoids in dynamics of leaf minor communities.</p> <p>(u) Knowledge based systems for cereal aphid control.</p> <p>(w) The assessment of canopy structure in Calluna heathlands through remote sensing.</p> <p>(y) Electron transport mechanisms in nematodes.</p> <p>(z) Determinants of symptom induction in plants by red clover necrotic mosaic virus.</p> |
|---|---|

The studentships will be funded by SERC, NERC, MRC and AFRC. Applicants should have or expect to obtain a 2.1 or 1st class honours degree in a Biological Science subject.

Apply by submitting a curriculum vitae, including the names of two academic referees to the **Academic Administrator, Department of Pure & Applied Biology, Imperial College, Prince Consort Road, London SW7 2BB**, or telephone 01-589 5111 extn 7407 for further details. (9008)F

### UNIVERSITY OF ABERDEEN

#### Advance Course Studentships M.Sc. in Human Metabolism and Nutrition (Research and Experimental Methods)

Applications are invited for Research Council Advance Course Studentships for this full time 12 month course which provides systematic instruction and practical experience in the fundamental methods and techniques relevant to human metabolism and nutrition in health and disease. The course is designed for graduates who wish to pursue a career in which a critical and innovative approach to human nutrition is important.

Candidates should have a medical qualification or a good honours degree in a biomedical science.

Closing date for applications is June 30th 1989.

**For further details and application forms write to Dr C E Casey, Department of Medicine & Therapeutics, University of Aberdeen, Polwarth Building, Rm 301, Foresterhill, Aberdeen AB9 2ZD.**

(8955)F

the widest international selection of jobs in science — EVERY WEEK

## STUDENTSHIPS continued

**UNIVERSITY OF BRISTOL and WELLCOME FOUNDATION LTD  
MRC Collaborative Research Studentship**

A studentship is available from 1st October, 1989, to study "The mechanisms of lactate and pyruvate transport across the plasma membrane of the malarial parasite". The project will involve culturing the malarial parasite, measurement of transport kinetics, identification and purification of the carrier and production of monoclonal and polyclonal antibodies. The work will form part of a programme of research directed towards finding alternative forms of chemotherapy for malaria that has become resistant to quinine-related drugs. The project will be supervised by Dr. A.P. Halestrap in the Department of Biochemistry at the University of Bristol, and Dr. W.E. Gutteridge in the Biochemical Sciences Department of the Wellcome Research Laboratories, Beckenham, Kent. Personal remuneration of the student will be in excess of £4000 per annum, and he will be expected to spend periods of time totalling not less than a year at the Wellcome laboratories.

Applications are invited from honours Biochemistry or Microbiology students who expect to gain at least an upper second class degree and should be made to Dr. A.P. Halestrap, Department of Biochemistry, School of Medical Sciences, University of Bristol, Bristol BS8 1TD (Tel. 0272 303030) by 12th May. A curriculum vitae and the names and addresses of 2 academic referees should be included. (8997)F

**PATERSON INSTITUTE FOR  
CANCER RESEARCH**

CHRISTIE HOSPITAL &  
HOLT RADIUM INSTITUTE

**MRC POSTGRADUATE  
RESEARCH STUDENTSHIP**

An MRC funded PhD studentship will be available in the Paterson Institute from 1st October 1989 supervised by Professor T M Dexter and Dr J Gallagher. The studentship is for 3 years and will carry the normal MRC stipend.

The purpose of the research project is to study the role of the extracellular matrix (ECM) of bone marrow in the regulation of normal haemopoiesis and in the development of leukaemia. It is anticipated that special emphasis

will be placed on the heparan sulphate proteoglycan component of the ECM and the molecular basis of its interaction with growth factors.

The Paterson Institute for Cancer Research is a multidisciplinary research centre offering excellent opportunities for research.

Applicants should have, or expect to gain, a first or upper second class honours degree in an appropriate subject. Please submit a detailed CV including the names of two academic referees to Professor T M Dexter, Paterson Institute for Cancer Research, Christie Hospital & Holt Radium Institute, Wilmslow Road, Manchester M20 9BX, to arrive no later than 4th May 1989. (8959)F

**UNIVERSITY OF BRISTOL**
**Research Assistantship in the Department of Geology  
Homology and convergence**

A three-year post, starting in October, 1989, is available as part of a project on Homology, convergence and taxonomic characters of fossil and living tetrapods. The project is funded by SERC, and will be supervised by Dr M J Benton. The work involves study of the morphological characters, comparison of competing cladistic phylogenies using computerised techniques. Candidates should possess a good honours degree in Biology Sciences and/or Geology. This work will lead to submission for a Ph.D.

Salary on scale £8,675 – £11,680 (Research 1B scale, under review).

For further details telephone Bristol 303136 (ansaphone after 5.00 p.m.) or write to the **Personnel Office, Senate House, Bristol BS8 1TH**. Please quote reference A337.

Closing date three weeks from the date of appearance of this advertisement.

An Equal Opportunities employer.

## COURSES &amp; CONFERENCES

**Royal Postgraduate Medical School**

(University of London)

**M.R.C. Clinical Research Centre  
Northwick Park Hospital &  
Department of Clinical Oncology,  
Royal Postgraduate Medical School**

# Viruses, Cancer and Aids

19-21st. June 1989

The first international symposium in this exciting area drawing together interested scientists and clinicians. Organised by the M.R.C. Clinical Research Centre and the Royal Postgraduate Medical School.

**Speakers include:**

W. Bodmer	London	S. Salk	N.I.H.
P. Farrell	London	J. Weber	London
R. Gallo	N.I.H.	H. Thomas	London
K. Sikora	London	D. Onions	Glasgow
B. Griffin	London	P. Volberding	San Francisco
W. Gullick	London	A. Dalglish	London
R. Honess	London	K. Vousden	London
R. Rickinson	Birmingham	D. Crawford	London
C. Rooney	London		

**Topics:**

EBV, HBV, HPV6, papillomaviruses, HTLV-1, HTLV-2, HIV, Kaposi's sarcoma, animal models of oncogenesis, tumour suppressor genes.

**Organisers:** A. G. Dalglish  
K. Sikora

**Course fee (including catering): £200**

**Further details from: Wolfson Conference Centre  
Royal Postgraduate Medical  
School  
Hammersmith Hospital

## UNIVERSITY OF SOUTHAMPTON Institute of Cryogenics

### M.Sc/Diploma in SUPERCONDUCTIVITY AND CRYOGENICS

(A new 1 year course of lectures, laboratory work and research project)

The discovery of high transition temperature superconductors has produced an explosion in the number of people engaged in research on superconductivity. New materials are being developed with excellent properties for an expanding range of applications. The demand for people with a good training in superconductivity and cryogenics is increasing rapidly.

This course, at the Institute of Cryogenics, provides a thorough grounding in superconductivity and its applications together with the necessary cryogenics. The course is suitable for science or engineering graduates as a full-time course over 12 months or as a part time course over 24 months.

The course consists of lectures in the first two terms, laboratory and tutorial work in the first term followed by 540 hours of project work. After passing written examinations during the third term, students will continue work on a research project leading to the presentation of a thesis.

The lectures include: fundamental aspects of superconductivity in high transition temperature ceramics and in conventional materials; production and properties of practical high  $T_c$  materials and devices; instabilities and protection of superconducting systems; large scale and small scale applications of superconductivity: production, storage, handling and safe use of cryogenics fluids in support of superconducting systems.

A limited number of Advanced Course Studentships are available. Further details and applications: **The Director, Institute of Cryogenics, University of Southampton, Southampton SO9 5NH** (8952)C

(University of Cambridge)**

Ninth Annual Bristol-Myers Symposium on Nutrition Research

## New Techniques in Nutritional Research

**11-13 September 1989**

A three day residential Symposium to discuss new techniques now available for Medical Researchers wishing to carry out nutritional investigations will be given by a team of international doctors and scientists at Robinson College, Cambridge. The purpose is to introduce the scientific principles behind these techniques and to discuss their practical applications both for clinical public health research in industrialised as well as Third World Countries.

This Symposium is part of a series on nutritional science funded by an unrestricted nutrition research programme of the Bristol-Myers Company of the United States.

**Range of Topics Covered:** The subjects covered on the first day will include the use of stable, nonradioactive, isotopic techniques to study energy balance and caloric requirements, as well as protein, vitamin and mineral status. On the second day, topics which will be considered are the measurement of body composition using classical and modern approaches, such as neutron activation analysis, total body electrical conductivity, bioimpedance, NMR imaging, CAT scanning and photon-densitometry. There will also be opportunities for 'hands on' inspection of some of the techniques in action on the optional third day (13 September).

**Symposium speakers will include:** Prof M J Rennie (Scotland); Prof V R Young (USA); Dr P D Klein (USA); Dr H J Powers (England); Prof J R Turnland (USA); Dr D Halliday (England); Dr R G Whitehead (England); Dr W A Coward (England); Dr A M Prentice (England); Dr M Elia (England); Prof W P T James (Scotland); Prof J S Garrow (England); Prof A F Roche (USA); Dr S H Cohn (USA); Prof M Fiorotto (USA); Prof H C Lukaski (USA); Prof G B Forbes (USA); Dr E M Widdowson (England); Prof L D Hall (England); Dr A K Dixon (England); Dr A Horsman (England); Dr P Tothill (Scotland); and Prof H W Wahner (USA).

**Symposium Organisers:** Dr Roger Whitehead and Dr Ann Prentice

**Fee:** (including residence for three nights, all meals, banquet and social events): £220 incl. VAT.

**Continuing Medical Education Creditation:** Will be available via the University of Cincinnati.

**Application forms available from:**

Mrs Maureen Gammons	or: Ms Susan Yarin
MRC Dunn Nutrition Unit	Bristol-Myers Company
Downhams Lane	345 Park Avenue
Milton Road	New York
Cambridge CB4 1XJ	NY 10154
England	USA

A programme will also be organised for accompanying persons. (8964)M

## cDNA CLONING: A PRACTICAL COURSE

Department of Biochemistry  
University College London  
26-30 June 1989

An intensive one-week laboratory course in the techniques of cDNA cloning. The practical course will include (1) the construction of a cDNA library in  $\lambda$ gt 10, (2) the screening of  $\lambda$ gt 11 libraries using both antibody and radio-labelled DNA probes, (3) detailed restriction mapping of cloned genes. In addition to the practical sessions there will be lectures discussing the methods which allow efficient construction and screening of cDNA libraries and their application to biological, medical and biotechnological problems.

**Course fee: £750** (exclusive of accommodation)

Bed and breakfast accommodation can be provided in a local hall of residence at £84 for the week.

Write for application form and further details to:

H A White  
Department of Biochemistry  
University College London  
Gower Street, London WC1E 6BT

Numbers will be limited. Closing date for applications:  
30 May 1989. (8976)C

THE UNIVERSITY OF SIENA ORGANIZES A 2 WEEK-LONG  
October 9 to 22, 1989

## "SUMMER SCHOOL FOR A MULTIDISCIPLINARY ASSESSMENT OF ENVIRONMENTAL RISKS FOR HUMAN HEALTH"

### CONTAMINANTS IN THE ENVIRONMENT

#### TOPICS:

- distribution, levels and fate;
- comparative aspects of metabolism and toxicity
- detoxication strategies;
- damage to biological structures;
- pesticides and risks for human health.

Food, lodging and travel expenses provided for 15 Italian students; food, lodging and part of the travel expenses for 15 foreign ones.

Degree in Medicine or Biology is required. Degrees in related fields will also be considered.

Official language: English.

Immediately forward application, curriculum vitae, list of publications, letters(s) of recommendation and a brief abstract regarding one of the School topics (or your personal research) for possible short presentation during the School, to:

**Prof. A. Renzoni**

# Are you a science detective?

Do you spend hours searching the library shelves for clues to the whereabouts of this week's issue of Nature or waste time tracking down the last person on the circulation list?

Whether it's the latest developments in AIDS vaccines, maps of the sea bottom, debates on Darwinism or details on supernovae explosions that you're looking for, you need search no longer.

A personal subscription to Nature puts the most recent scientific developments in your hands only hours after the text goes to the printers.

Not only that, but you can read Nature at your leisure without fear of being chased by librarians or colleagues frantic for that one treasured copy.

You can even build up a permanent Nature reference library with its own Nature Index to make the information instantly accessible and ready to hand.

## Stop the search now

Take out a personal  
subscription to Nature  
today at **HALF PRICE**.

# CUSTOM GENE LIBRARIES IN A FLASH

## With Stratagene's Innovative Vectors And Improved Gigapack™ II Gold Packaging System

Stratagene offers a custom cDNA and genomic library service. Each library is constructed using Gigapack™ II Gold packaging extract (our newest packaging system: mcrA, mcrB, mrr-, hsdR-) and your choice of innovative cloning vectors.

### cDNA Libraries

Send us your poly (A+) enriched mRNA (we recommend the use of Stratagene's RNA isolation kit for isolating total RNA - catalog #200345). We will construct a library containing from  $1 \times 10^6$  to  $1 \times 10^7$  primary recombinant plaques depending on the integrity of the mRNA. Stratagene will also amplify your library at no extra charge. Libraries will be constructed in one of the following lambda phage vectors of your choice: The Lambda Zap®II vector, the Uni-Zap™ XR vector, Lambda gt10, or Lambda gt11 vectors.

### Genomic Libraries

Send us your genomic DNA. Stratagene will perform partial or complete digests and size fractionate the DNA. Stratagene will construct a library containing from  $1 \times 10^6$  to  $1 \times 10^7$  primary recombinant plaques. If desired we will amplify your library at no extra charge. Libraries can be constructed with the Lambda FIX™ II vector, the Lambda DASH™ vector, Lambda EMBL3, EMBL4, or the cosmid vector pWE.

### Pre-Constructed Libraries

Stratagene offers a large selection of pre-constructed libraries. Most are prepared with Stratagene's innovative vectors and are available for immediate delivery. Please call for information on our latest selection. Stratagene guarantees your complete satisfaction.

# We specialize in quality, custom peptide synthesis . . . so you don't have to!

Our proprietary techniques enable MPS to supply you with all the custom peptides you need. For example, we can provide over 100 completely different 15-residue peptides in as little as three weeks. An analytical HPLC chromatogram is included with each peptide ordered.

MPS offers quality peptides with service we're sure you'll like. Call us with your questions or if you would like a complete price list.

MPS also provides a custom HF Cleavage Service and a unique HF Cleavage System.

## COMPARE OUR PRICES

MPS is offering custom peptides at the extraordinary prices listed below.

10mer	\$400
15mer	\$550
20mer	\$800

Prices are based on 50mg of HF Cleaved Peptide. 4 to 6 weeks delivery, minimum order of 3 peptides or \$1000.

## CAN YOU SYNTHESIZE PEPTIDES FOR LESS?

Before you buy an automated peptide synthesizer, you should consider the actual cost for in-house synthesis which includes the cost of reagents, personnel, service contracts, analysis, waste disposal, downtime and, of course, the initial cost of the synthesizer.

Magainin (Tryptophan 20 analog)  
GIGKFLHSAGKFGKAFVGEIWKKS

HIV gag protein segment  
GRPGNFLOSREPTAPPFLQSRPEP

HPLCs of unpurified, HF cleaved peptides

IMPROVED

## GIGAPACK™ II

Packaging Extract  
mcrA<sup>-</sup>/mcrB<sup>-</sup>/mrr<sup>-</sup>/hsdR<sup>-</sup>Maximum  
Efficiencies

- ▶ Generate the most complete libraries
- ▶ Obtain those "non-clonable" inserts

Once again Stratagene breaks new ground by introducing Gigapack™ II lambda phage packaging extract. All mcrA, mcrB, mrr, and hsdR restriction activity has been eliminated from our Gigapack II extracts<sup>1</sup>. The mcrA and mcrB restriction systems of *E. coli* will damage DNA containing 5-methylcytosine. Since 5-methylcytosine occurs naturally in genomic DNA from plant and animal cells, many genomic regions are difficult or impossible to clone. Lambda phage packaging extracts generally contain residual mcrA, mcrB, mrr and hsdR activity. Gigapack II packaging extracts do not contain this activity. The elimination of mcrA and B restriction systems greatly increases the representation and size of lambda and cosmid genomic libraries, especially when using DNA from species having a substantial degree of methylation. Moreover, there are genomic regions in most species that are highly methylated and thus difficult or impossible to clone. Elimination of hsdR restriction activity allows the cloning of inserts bearing Eco K restriction sites, which are not protected by 5-methylcytosine.

Gigapack II packaging extract is also useful for cloning cDNA that has been synthesized using 5-methylcytosine, such as with Stratagene's new unidirectional ZAP™ cDNA synthesis kit. Gigapack II is simple to use and is available in the following kits:

NAME	FEATURES	REACTIONS	CAT#
Gigapack II Gold	2x10 <sup>9</sup> pfu/μg λ DNA	11	200216
Gigapack II Plus	1x10 <sup>9</sup> pfu/μg λ DNA	11	200213
Gigapack II XL	Designed for size selective packaging	11	200219

New restriction minus *E. coli* strains are also available to further improve library representation. The mcrA<sup>-</sup> and mcrB<sup>-</sup> P2 lysogen strain, P2PLK17, permits use of the efficient Spi<sup>-</sup> selection system for low levels of nonrecombinant background clones in genomic library preparation. PLK-F<sup>-</sup> and PLK17 are available for generating efficient unidirectional cDNA expression or subtraction libraries.

Gigapack II is even more effective with methylated DNA using Stratagene's new restriction minus plating hosts CPLK and P2CPLK, which are derived from *E. coli* C.

<sup>1</sup>Kretz, P.L. and Short, J.M. (1989) *Strategies* Vol. 2 No. 2

NAME	CHARACTERISTICS	CAT #
P2PLK17	RecA <sup>+</sup> , mcrA <sup>-</sup> , mcrB <sup>-</sup> , Spi Selection, lac <sup>-</sup> , hsdR <sup>-</sup> M <sup>+</sup>	200290
PLK-F <sup>-</sup>	RecA <sup>-</sup> , mcrA <sup>-</sup> , mcrB <sup>-</sup> , hsdR <sup>-</sup> M <sup>+</sup> , F' (lacZ Δ15, lacI <sup>q</sup> )	200282
PLK17	RecA <sup>+</sup> , mcrA <sup>-</sup> , mcrB <sup>-</sup> , lac <sup>-</sup> , hsdR <sup>-</sup> M <sup>+</sup>	200291
CPLK	RecA <sup>+</sup> , lac <sup>-</sup> ( <i>E. coli</i> C)	200292
P2CPLK	RecA <sup>+</sup> , lac <sup>-</sup> , Spi selection, ( <i>E. coli</i> C)	200293

Figure Legend:

Highly methylated eukaryotic DNA was packaged with Gigapack II extract and three other commonly used lambda packaging extracts. The packaged DNA was then plated with the methylated cytosine restriction minus (mcr<sup>-</sup>) *E. coli* strain PLK17. The relative packaging efficiencies are shown.

# A universal DNA and protein engineering system

## Up to 95% mutants – in all applications

### Any mutation

Optimized for point and insertion or deletion mutagenesis; the integral exonuclease step in the Amersham protocol eliminates the non-mutant sequence, making this the system of choice for constructing insertion and deletion mutations.

### Any vector

Any single-stranded vector with one or more *Nci* I sites can be used – M13 or plasmid-based, for example, pEMBL.

### Any host

The system produces homo-duplex mutant molecules *in vitro*, so no specialized hosts are required at any stage.

The proven Amersham oligonucleotide-directed *in vitro* mutagenesis system now ensures highest efficiency mutagenesis with increased convenience in all applications – making this the most efficient and versatile DNA and protein engineering system available.

Oligonucleotide-directed *in vitro* mutagenesis system  
Version 2, code RPN 1523.

# nature

27 April 1989

Vol. 338 Issue no. 6218

The cover shows the installation of part of a magnet assembly in the 'L3 experiment' at CERN, one of the European laboratories covered in this week's Science in Europe supplement, on pages 717-736.

## THIS WEEK

### Fusion in print

"When a current is passed through a palladium electrode immersed in an electrolyte of deuterated water and metal salts, a small but significant flux of neutrons is detected. Fusion of free deuterons within the palladium lattice may be the explanation." Read on, on page 737. Discussion of the cold fusion phenomenon continues in News and Views (pages 701, 705 and 710), Scientific Correspondence (page 711) and News.

### Neanderthal behaviour

A rare fossil find from Mount Carmel in Israel suggests that the morphological basis for speech

was fully developed in Neanderthal man 60,000 years ago, pages 758 and 702. At another archaeological site in Israel, radiometric dating sheds new light on the question of whether Neanderthals coexisted with modern man, page 756.

### Multiple sclerosis

A new study of sera and cerebrospinal fluid from thirty patients casts doubt on a previously proposed association between the paramyxovirus SV5 and multiple sclerosis, page 769.

### An ill wind

Monsoon conditions in the Indian Ocean are related to the high biological productivity of the Arabian Sea — and to global carbon dioxide. Page 749.

## AIDS incubation time

An up-to date figure for the mean incubation period for AIDS is provided by new data from analysis of 167 transfusion-related cases in France. The new estimate for the mean incubation time is 5.3 years, with a 90% confidence interval ranging from 4.4 to 8.9 years. Page 768.

## A costly business

In the fruitfly *Drosophila melanogaster*, mating with males greatly reduces lifespan in females whose rates of egg production and egg fertility do not differ. The results presented help to provide a better understanding of the cost of reproduction, page 760.

## An educating epitope?

The first direct evidence that there are conformational differences between major histocompatibility complex molecules found in the thymic cortex and medulla, page 765.

## Chemical bicentenary

Lavoisier's *Traité élémentaire de chimie* set the agenda for much of the work that followed. George Kauffman puts the case for Lavoisier as the founder of modern chemistry. Commentary, page 699.

## Malaria prevention

A human monoclonal antibody prevents knobless malaria-infected erythrocytes from adhering to blood vessels, contradicting the belief that such adhesion requires the knobs that are characteristic of infected cells and suggesting an approach to the prevention of cerebral malaria, page 763.

# Get the big picture in microplate analysis

## Flexible, multipurpose design with large LCD brings new ease to microplate reading.

Microplate analysis needs vary from person to person. So we designed the Model 3550 Microplate Reader and its on-board software to perform a wide variety of functions and analyses with a single instrument. *In fact, the Model 3550 reader can perform the work of three instruments: data processing, kinetic, and high volume microplate readers.*

**Flexible on-board software.** This unique software allows you to program the Model 3550 to collect and analyze the data, and produce four custom tailored reports: Absorbance, Matrix, Limit, and Evaluation. What's more, all formats, protocols, and reports can be viewed *in their entirety* on the exclusive 80 x 16 character liquid crystal display!

**Kinetics capable.** The Model 3550 Microplate Reader's high speed fiber optics, on-board plate mixer, and multiple

reading mode quickly and easily collect data for *kinetic and endpoint* analysis.

**High volume option.** Adding the optional 25-plate capacity Stack Loader instantly converts the Model 3550 Microplate Reader from a conventional single plate reader to an automatic multiple plate instrument. As your needs grow, so can the Model 3550 reader.

**Enhanced data analysis.** Create a powerful analysis team with the Model 3550 reader and the Microplate Manager™ software for the IBM® and Apple® Macintosh™ personal computers.

**See the future in microplate analysis in your lab.** Contact your Bio-Rad representative for a demonstration. Or call and request bulletin 1438 for detailed information on our complete line of microplate analysis products.

# GENECLEAN™

**WHY SHOULD IT BE SO TIME-CONSUMING OR DIFFICULT OR EXPENSIVE TO DESALT OR PURIFY DNA SOLUTIONS, OR REMOVE DNA FROM AGAROSE?**

**IT SHOULDN'T ...**

**AND NOW IT ISN'T. BIO 101 INTRODUCES GENECLEAN™ A "QUICKIT" THAT ENABLES THE MOLECULAR BIOLOGIST TO:**

 **REMOVE AND PURIFY DNA FROM AGAROSE GELS FAST** ... 20 minutes from Gel-Band to purified DNA in water or TE.

 **REMOVE UNREACTED TRACER-NUCLEOTIDES FROM LABELING REACTIONS and/or DESALT AND CONCENTRATE DNA SOLUTIONS, EVEN THOSE IN PHOSPHATE, FAST** ... 15 minutes without columns, alcohol precipitations or organic extractions.

 **ELIMINATE ENZYME-INHIBITING IMPURITIES FROM DNA SOLUTIONS FAST** ... 15 minutes to remove protein, small RNA and other enzyme-inhibiting impurities from DNA solutions. For example, remove RNA and protein from crude miniplasmid cleared-lysates without protease, RNase, organic extractions or alcohol precipitations.

 **ELIMINATE NEED FOR ALCOHOL PRECIPITATION OF DNA** ... 15 minute **GENECLEAN** process serves the same purpose as alcohol precipitation of DNA, often with increased recovery.

 **REMOVE TRACES OF ORGANIC SOLVENTS FAST** ... 15 minutes to remove residual enzyme-inhibiting phenol, chloroform or ether from extracted solutions of DNA.

 **"QUICKCLONE" FROM HIGH MELTING-POINT AGAROSE GELS.**

**BIO 101**

"DURING THE COURSE OF DOING RESEARCH, CHECK WITH BIO 101 ... WE HAVE YOUR TIME IN MIND."

**MAILING ADDRESS:**

BIO 101, INC., P.O. BOX 2284, LA JOLLA, CALIFORNIA 92038-2284

**LOCATION:**

## Your First Choice for Cytokine Research Products

### A history of firsts; a future of firsts.

In 1982, Genzyme introduced the first commercial source of Interleukin-1. Today, we offer the most complete line of products available for cytokine research, and tomorrow, we'll continue to provide you with new products relevant to your new needs.

### Our complete product line includes:

#### Interleukins (IL)

- Interleukin-1 (alpha and beta)
- Interleukin-2
- Interleukin-3
- Interleukin-4
- Interleukin-5
- Interleukin-6
- Antibodies to Interleukins
- InterTest-2™ IL-2 ELISA kit

#### Colony Stimulating Factors (CSF)

- Granulocyte-Macrophage CSF
- Granulocyte CSF
- Macrophage CSF
- Antibodies to CSF's
- Factor-Test™ GM-CSF ELISA Kit

#### Tumor Necrosis Factor (TNF)

- Ultrapure TNF-alpha
- Recombinant TNF-alpha
- Antibodies for Neutralizing TNF-alpha and TNF-beta (lymphotoxin)
- Antibodies for Western Blot Analysis of TNF-alpha
- TNF-Test™ TNF-alpha RIA kit

#### Platelet-derived Growth Factor (PDGF)

- Recombinant Human PDGF
- Antibodies to PDGF

#### Additional Products for Immunology Research

- Interferon-gamma
- Antibodies to Interferon-gamma
- Antibody to Erythropoietin
- Recombinant Ultrapure Protein-A
- Recombinant Protein-A Agarose
- Chicken Collagen II

### Our commitment to you.

Genzyme is committed to providing the research community with the highest quality products available. All of our products are subjected to rigorous quality control testing for purity, bioactivity, cross-reactivity, sterility and endotoxin.

In addition, Genzyme's scientific staff is ready to assist you with technical product support.

### Order today for delivery tomorrow!

Our Cytokine products are available as both recombinant and natural preparations and are of human or murine origin. Genzyme also supplies monoclonal and polyclonal antibodies and complete immunoassay kits. For more information or to place an order for next day delivery, call or write today.

# IT IS NOT WORTH TAKING THE SHOT IF YOU ARE UNCERTAIN ABOUT THE QUALITY OF YOUR PEPTIDES.

**Y**ou can waste a lot of time, effort and money on your research if you are not sure about the quality of your peptides. At NEOSYSTEM we feel you should not have to make the choice between price and quality. Thanks to our multi-peptide synthesiser developed in house, we are able

to produce many different peptides simultaneously. This means we can offer high quality peptides at low costs with short delays. Contact us now to discuss your custom peptide requirements.

3 levels you can choose from:

**GOLD** minimum 98 % pure  
900\* FF/residue

**SILVER** minimum 85 % pure  
650\* FF/residue

**BRONZE** minimum 60 % pure  
400\* FF/residue

HPLC profile, amino acid analysis  
sold by net peptide weight 15-20 mg

HPLC profile, amino acid analysis  
sold by net peptide weight 25-50 mg

1 step purification, 200-300 mg

\* all prices +/- 20% depending on sequence and amount required.

## The hidden side of pipetting

It's not so easy. In chemistry, in microbiology, in biochemistry, pipetting is a speciality.

Dispensing precise volumes with assurance requires the finest instruments and flawless technique.

Only Gilson pipetting systems can guarantee the long-term accuracy and precision you require.

Our pipetting systems are built to be better. When you take a Pipetman in your hand, it feels solid, dependable.

If you look closer, you'll see why.

Inside, you'll find a wearproof piston assembly and resistant seals for constant performance even in a cold room. The entire mechanism functions smoothly, cleanly. No grease, no oil.

Outside, the shock-proof handgrip has a low thermal coefficient. Body heat does not affect the precision of the pipette after prolonged use. And Gilson pipettes are easy to hold stable (for good reproducibility).

Now look at your pipette tip. Gilson tips are manufactured with the same painstaking care as our pipettes.

For more information, please contact your nearest Gilson representative.

Beijing.

If it doesn't work  
for you, it doesn't  
work for us.

Satisfaction needs more than simply good specifications. It needs an understanding of how life scientists think and work. Satisfaction means delivering total solutions in Standard chromatography – solutions that work.

That's why we begin by discussing your application. How do you need to work to realize the result you seek? When we understand your total need, we can recommend total solutions. These solutions include experience, training, media, instruments, service, . . . all the factors that add up to satisfaction.

Dr. Bo Malm

Scientific service and Technical support  
Pharmacia LKB Biotechnology, Uppsala

Our cooperation can begin during one of our well-known courses on chromatography, from reading our many technique handbooks, or when you discover a method in the many thousands of published literature references to our products. And we are also always happy to discuss our broad range of modern gels, each designed to give you optimum results regarding time, resolution and sample.

Whether you need media or a monitor, a column or a collector, we're ready to listen. You will be offered a system tailored to your individual requirements, a remedy built on modular components that provide the flexibility needed for easy expansion. And, as we have proved during the past 35 years, our commitment to quality, service and reliability is more than a promise.

We'll never forget that our solutions are only as good as your results. At Pharmacia LKB, we're committed to helping you manage biomolecules better.

# Is protein chemistry an art or a science?

The art  
of protein  
chemistry is  
the experi-  
mental design.

The science is the  
correct interpretation  
of results. Just as the protein chemist  
integrates art with science, Applied  
Biosystems integrates chemistry and  
instrument design with application ex-  
pertise to become partners with you in  
developing solutions to your problems.

The complexity of the protein  
molecule poses a unique analytical  
challenge. Applied Biosystems' broad  
product portfolio—sequencers,  
synthesizers, amino acid analyzers,

HPLC, high  
performance  
electrophoresis,  
capillary electro-  
phoresis—represents  
a few of the techniques

needed for structural  
elucidation. Leading-edge instrumen-  
tation must be combined with clear  
insight and intuition to be successful.

Breakthroughs in protein  
chemistry derive from intuition and  
systematic analyses. Applied Biosystems  
recognizes this. We invite you, our  
partners in  
research, to share  
your viewpoint.

# BIO Technica

## Intern. Trade Fair + Congress for Biotechnology Hannover 17th – 19th Oct. '89 The World Forum for Biotechnology

### Trade Fair

About 500 international exhibitors from industry, large-scale research centres and university institutes will be presenting a comprehensive display of application-orientated biotechnology.

The exhibition programme:

- BT research
- BT processes and products
- BT laboratory and production technology
- BT services
- BT applications in pharmacy, the chemical industry, food production, agriculture, environmental protection, bioenergy, raw material extraction and consumer goods

### Congress and Seminars

A venue for experts from all over the world.

The congress themes in '89:

- 17.10.89: Protein engineering
- 18.10.89: Chromatographic techniques for extracting bio-products
- 19.10.89: Polysaccharides and oligosaccharides – production and utilization

These are supplemented by accompanying seminars and workshop based upon practical experience and intended for practical application.

## How to lose with nothing to lose

NATO is making heavy weather of battlefield weapons in Europe. It would find it easier to modernize its forces if it would negotiate as well, and that way would also keep its friends.

Mr Dick Cheney, the new US Secretary of Defense, will not win many friends in Europe with his statement at the weekend that if the West were to embark on negotiations on short-range nuclear weapons, "there's a very real danger" that the end result would be a "de-nuclearized" Europe. "What would be so wrong with that?" is how many people will respond. Especially if there is also a cast-iron deal on the numbers and character of the conventional forces deployed in Europe by the Warsaw Pact and the North Atlantic Treaty Organization (NATO). In short, Cheney's remark may serve only to strengthen the growing body of opinion in West Germany whose clamour sent Hans-Dietrich Genscher, the Foreign Minister, and Gerhard Stoltenberg, the Defence Minister, scurrying from Bonn to Westminster to put the case for negotiations.

NATO, and the United States and Britain in particular, are in danger of talking themselves into a false position on this issue, which is neither new nor obscure. NATO's European strategy, which goes back to the early 1960s, is explicit, even correct. Supposing (or at least believing) that the Warsaw Pact's forces are the stronger on the ground, Western strategy has relied on battlefield nuclear weapons to beat back an overwhelming conventional attack. But now there are serious negotiations under way at Vienna on the mutual regulation of conventional forces, launched propitiously by the Soviet Union's unilateral decision last December to reduce its armed forces by 500,000 men and women and to withdraw 15,000 tanks from the European region. NATO is well within its rights to say (as it does) that those reductions will not make a stable Europe, and to ask for more to match whatever reductions are offered by the West. But if there is a chance of reaching an acceptable balance on conventional forces, and if short-range nuclear weapons are meant to make up for the West's perceived deficiencies in that area, it must make sense to talk about both at the same time.

So why is NATO so hesitant? One consideration is its wish to replace some of its battlefield weapons with modernized Lance missiles (with a range of 500 kilometres) and, no doubt, to remove many others from Europe altogether. The West German government has been a reluctant partner in that process because many of those who elected it to office would prefer negotiations to modernization, and might elect another government next

spring if they do not get their way. Sympathetic to Chancellor Helmut Kohl's difficulties, some other NATO members have been saying that the decision about Lance could be postponed until after the elections. That explains why the NATO communique last week spoke only of bringing battlefield nuclear weapons "up to date", without saying how or when. West Germany agreed. The significance of the form of words has since been fully explained by NATO governments, Cheney's among them: it amounts to a postponement of a decision about Lance until after the West German elections. Yet West Germans read newspapers as avidly as anybody. If Genscher, one of the minority Free Democrats in the West German Cabinet, has concluded that this form of words, and its intention, has provided the opposition parties with a blunderbuss, that merely shows that he is an experienced politician. No wonder he wants a new understanding.

NATO's fear of negotiations on battlefield weapons is harder to understand. Cheney spoke as if negotiations could have only one end-point: abolition. The logic is elusive. Who believes that the conventional arms negotiations will ban tanks from Central Europe? Why cannot the West appreciate that negotiations on battlefield nuclear weapons could, instead, be an opportunity to convince the Warsaw Pact (and even West German electors) that Lance missiles, being less in danger of conventional capture than, say, nuclear artillery, might be the best embodiment of Western weapons?

Cheney also seemed to argue at the weekend that negotiations are to be avoided because the Soviet Union has always wanted a "de-nuclearized Europe". It is true that Mr Mikhail Gorbachev has sometimes echoed his predecessors in saying that. But what Gorbachev has recently been asking is that there should be negotiations. His argument is cogent (see *Nature* 338, 527; 13 April 1989), and deserves a constructive answer. As time passes, Cheney will find it easier to say "yes" than "no".

The unspoken part of the dialogue is that which affects the nuclear weapons of European states themselves, Britain and France. So far, neither's nuclear planning has been much affected by arms control negotiations. The unratified SALT II treaty, which constrained allowable numbers of Soviet and US strategic missiles, implicitly took account of these peripheral forces, but without direct commitment by their operators: ironically, the

moral force of the treaty is such that the major powers abide by it, but Britain and France can build what weapons they choose. The British Prime Minister, Mrs Margaret Thatcher, has said she will consider negotiating about British weapons when the major powers have a strategic agreement, which will not be tomorrow. Her French counterparts have said nothing. Yet each of them will also have to say "yes" at some stage. □

## Oppressed press

Lacking constitutional protection, British newspapers are under pressure to reform — or be regulated by law.

AMERICANS concerned with press freedom are constantly surprised to find the British government banning books and suppressing news. No doubt that is why, last week, Mr Dana Bullen, the former *Washington Star* journalist who heads the World Press Freedom Committee, told an International Press Institute conference (called to discuss growing press censorship in Britain), that much of the new British Official Secrets Act is "unconstitutional".

Such parochialism, in the days of *Spycatcher*, is no longer excusable. Britain does not have a First Amendment any more than it has a Grand Canyon or a President. The US Congress may pass no law restricting freedom of the press. The British Parliament can. One private member's bill, which would have given a statutory right of reply to those who claim to be victims of inaccurate reporting, was rejected last week. Another — protecting privacy — is expected also to fail. But there is to be an independent inquiry into the conduct of British newspapers. The press, said Mr Timothy Renton of the Home Office, announcing the inquiry, has a year or two "to clean up their act". If not, Parliament will do what Congress cannot.

In last week's debate, much rage was vented against the newspapers, particularly the tabloids. But Renton, among other top Tories, expressed a deep reluctance to introduce restrictions of a kind not seen since the time of Cromwell. The Thatcher government, nonetheless, shows no inhibition at all in trying to censor the much-more-regulated medium of broadcasting. As things are, shocking as it is to many outside Britain, legally elected representatives of the legal Irish nationalist organization, Sinn Fein, including one elected to the Westminster Parliament, are banned from British radio and television. (At least, their voices are: pictures may be shown, with others speaking their words.) But the anger at the supposed damage done by the media could be extended to curbs on the press.

Those who deplore this prospect should keep in mind three factors that do not exist in the United States. One is active terrorism, ready to strike at any time. The Prime Minister was nearly killed by the Provisional IRA at Brighton in 1984 (and five of her colleagues perished). Earlier, one of her closest friends had been killed by a bomb within the precincts of Parliament itself. The second

factor is that there is a large number (eleven) of national newspapers, engaged in a bitter circulation war with each other; many will do anything to gain an advantage over their nearest rival. The third is the royal family. These unfortunate people, unlike pop stars or television personalities or politicians, are ordinary in every way except birth. Yet the smallest detail of their private lives can sell millions of papers. Privacy laws, such as those in the United States, protect people not in the public eye, on the assumption that celebrity is somehow voluntary. It will be hard in Britain to draw up comparable laws because of this royal anomaly.

Hope that legislation may be avoided lies in the intellect and personality of the new chairman of the Press Council, Mr Louis Blom-Cooper, QC. An ardent admirer of the First Amendment and a civil libertarian lawyer of international repute, Blom-Cooper has, for the past few months, led the British newspaper and magazine industry's own voluntary self-appointed regulatory body. He has sworn to make the council more responsive to public alarm. Last week he made an excellent start, by deciding that the council will conduct its own immediate inquiry into the photographic coverage by the tabloid newspapers of the Hillsborough disaster, when close on 100 people were crushed to death in a football stadium. The front-page full-colour close-ups of the faces of dying teenagers distressed many people.

The serious national newspapers — the broadsheets — consider themselves unjustly blamed for the sins of the sleazy tabloids, all lumped together as the unloved 'press'. But the so-called 'qualities' are not blameless. They seem arrogant. They do not carry correction columns of routine errors. They do not have ombudsmen to whom the public may take its grievances. And they do not editorially scold the tabloids when these — as Mr Rupert Murdoch's do — refuse to publicize the rebukes the Press Council gives them.

The British government is not blameless either. It has done nothing to prevent the concentration of newspaper ownership, which only intensifies the tabloids' circulation wars. Murdoch, who already owns *The Times*, the *Sunday Times*, the *Sun* and the *News of the World*, was allowed also to buy *Today* without the sale being referred to the Monopolies and Mergers Commission. And the Prime Minister has bestowed a knighthood on the editor of the *Sun*, apparently forgiving him for its pornographic daily page three because of his paper's staunch Toryism.

The best outcome of the rocky year ahead would be for the Press Council and the independent inquiry to persuade the national newspapers that they must make themselves visibly more responsive to public complaints. That might stave off worse. Bullen last week supposed the virtues of the US system to be so plain that it must have been copied elsewhere. But it has not been. The British Parliament should not make laws telling British newspapers what and what not to print, but is in a mood to do so, and there is no constitution to prevent it. British newspapers, beware. □

# Hopes for nuclear fusion continue to turn cool

■ Press conferences continue

■ Verification mostly halting

## Washington

If the withdrawal by Stanley Pons and Martin Fleischmann of the cold fusion paper submitted to *Nature* bolstered rising scepticism, enough happened this week to keep hopes alive. Claims of successful fusion arrived from California, India and Brazil, and Pons himself hinted at new experimental evidence. But at the press conferences at which the announcements were made, hard data have been lacking and conclusions unclear; still no verdict can be reached.

One positive note is the publication in this issue of the more modest claim by Steven Jones and his colleagues, at Brigham Young University, who give evidence for a small but significant increase in neutron flux when current is passed through a palladium cathode in a suitable electrolytic cell. Jones and his group believe that fusion is occurring, but at a level much below what Pons and Fleischmann need to explain their energy production rate.

That claim is now at the centre of the debate. Neither in the published paper nor in the version submitted to *Nature* is there enough detail for readers to make their own estimations of the workings of the electrolytic cells. That and some other relevant issues are dealt with elsewhere (see pages 701, 705, 710 and 711).

At a press conference in Salt Lake City on 17 April, Stanley Pons announced a qualitatively new piece of supporting evidence: mass spectroscopy of the gases evolving from a working fusion cell revealed the presence of  $^4\text{He}$  in quantities consistent with the reported energy production, if all deuterium-deuterium fusions produce  $^4\text{He}$  rather than tritium and a proton or  $^4\text{He}$  and a neutron.

Cheves Walling, a colleague of Pons, says that gas from the cell was sampled and analysed, and a production rate of  $10^{12}$  atoms per second was deduced after the total gas flow rate had been figured in. This rate of helium production is much greater than in the 1926 'cold fusion' experiments (page 692), in which about  $10^{10}$  atoms were detected after several hours.

Walling and a colleague, John Simons, have submitted to the *Journal of Physical Chemistry* a theoretical paper suggesting how the high density of electrons in the palladium lattice could allow the high-energy photon expected, with a  $^4\text{He}$  nucleus, to be converted into lattice vibrations and thus heat. Although Walling

describes the theory as 'qualitative', he says that enhancements by many orders of magnitude of this normally rare fusion mode could be achieved.

At the 17 April press conference, Pons addressed an issue which has caused disquiet since it was brought up by Harold Furth, director of the Princeton University Plasma Physics Laboratory, at the recent meeting of the American Chemical society in Dallas, Texas (*Nature* 338, 605; 1989) — the lack of a direct comparison between an electrolytic cell containing heavy water and one containing ordinary water. Pons tantalized his audience by indicating that preliminary results from just such a comparison suggested an "unexpected" production of heat in the ordinary cell. There are no numbers.

A similar comparison between 'light' and 'heavy' electrolytic cells was described at Stanford University on 18 April by Robert Huggins, of the Materials Science Department. He said that when two cells, identical except that one used  $\text{H}_2\text{O}$  and the other  $\text{D}_2\text{O}$ , were run side by side with the same voltage applied, the heavy-water cell consistently ran the hotter by as much as 15 per cent. Huggins says that differences in the specific heat of heavy and light water, or in the diffusion rates of hydrogen and deuterium into the palladium electrode, are not large enough to explain the results.

Other groups are attempting similar comparisons, but none has yet reported success; Huggins says that there are "a couple of features" in his set-up that others may have missed, but these will not be revealed until a special session of the meeting of the Materials Research Society, scheduled for the evening of 26 April in San Diego.

In India, two groups claim to have achieved cold fusion in electrolytic cells similar to those used at the University of Utah. A third group, at the Bhabha Atomic Research Centre (BARC) in Bombay, is setting up a large-scale electrolysis reactor expected to produce results towards the end of May.

C.K. Mathews and colleagues at the Indira Gandhi Atomic Research Centre (IGARC) at Kalpakkam near Madras have reported neutron production from electrolysis of heavy water using a platinum anode and a titanium cathode. The team used an electrolyte of nickel and palladium chlorides at 0.2 per cent concentration rather than the lithium salt used by Pons and Fleischmann. "We observed a

30 per cent increase in neutron flux over the background level, suggesting that fusion was taking place", said IGARC director Dr C.V. Sundaram. No measurements were made of energy output. Sundaram said the results were not always reproducible because the experimental parameters had not been optimized.

In an almost identical set-up at the Tata Institute of Fundamental Research in Bombay, researchers claimed to have observed energy amplification, but they did not look for neutrons. Professor K.S.V. Santhanam and his colleagues in the chemical physics group said that passage of 0.25 watts of electrical power through the cell produced one watt of thermal output at the titanium cathode, whose temperature rose to  $80^\circ\text{C}$  in a sustained reaction. Heavy water mixed with sodium chloride was used as the electrolyte and platinum as anode in this experiment.

BARC's director, Dr P.K. Iyengar, said his group is setting up a much larger version of the Utah experiment with sophisticated instrumentation for measuring heat as well as fusion products. Results are expected in a month. But Iyengar, a well-known reactor physicist, is sceptical.

India is one of the few countries producing heavy water in commercial quantities and may therefore have an advantage if cold fusion is real. BARC is also interested in cold fusion as an inexpensive neutron source, which could be used, instead of fast-breeder reactors, to transmute India's 360,000-tonne reserve of thorium into uranium-233 fuel. But BARC's spirit has been dampened by reports that, whatever happens inside palladium, it does not produce a large neutron flux.

In Brazil, two groups have announced, by the now-traditional press conference, that they have obtained fusion reactions while trying to replicate the Utah experiments. The first team to report, from the Physics Institute of the University of São Paulo, said on 19 April that it had detected neutrons at twice the background level. Spero Penha Morato says that only a deuterium-deuterium reaction could account for this excess of neutrons, but the team was not equipped to measure heat production.

The second announcement, on 29 April, from the Institute of Space Research (INPE) in São Jose dos Campos in São Paulo state, says that a group headed by Gerson Otto Ludwig and known for work on fusion by magnetic confinement has reported two separate neutron bursts during a 100-hour experimental run. The first burst, after ten hours, had an intensity of ten times background; the second, after 35 hours, four times. At another press conference on 21 April, the same group announced it had detected  $^3\text{He}$ , thus proving that fusion reactions had occurred. □

# 1920s discovery, retraction

## Munich

WHILE researchers around the world spend sleepless nights in the laboratory trying to reproduce evidence of cold fusion, reports from the United States of a 1926 'mystery paper' on cold fusion in the German-language literature have sent more reflective physicists scurrying to their libraries.

Paul Allison and Klaus Lockner, of Los Alamos National Laboratory, began the chase by sending out an informal translation of a paper from the respected German researchers Fritz Paneth and Kurt Peters, in the 1920s at the Chemical Institute of the University of Berlin, reporting the creation of helium from hydrogen using a palladium catalyst. But the results were retracted eight months later, after new sources of error were identified.

The episode exhibits striking parallels to the current furore over cold fusion. The theory of the day could not explain the results of Paneth and Peters, but there was good reason at least to attempt the transmutation of hydrogen into helium. And the news caused great excitement, as indicated by the response in *Nature* (see excerpts reprinted on page 706).

Little was understood of thermonuclear fusion in 1926, although Paneth and Peters do mention in their introduction to their paper the hypothesis that helium is produced from hydrogen in stars. But neutrons were discovered only in 1932, and physicist Hans Bethe demonstrated in 1933 that fusion was the likely source of stellar energy.

Paneth and Peters published their results first in the journal *Berichte der Deutschen Chemischen Gesellschaft* (59, 2039; 1926). The results were then reprinted in *Die Naturwissenschaften* (14, 956; 1926). This paper and its 1927 retraction (*Berichte der Deutschen Chemischen Gesellschaft* 60, 808; 1927), reprinted in *Die Naturwissenschaften* (16, 379; 1927) are models of clarity. A letter of retraction was also sent to *Nature* (119, 706; 1927).

The technique for the spectroscopic detection of amounts of helium as small as  $10^{-8}$  cubic centimetres was by far the most difficult part of the experiment, and had taken 'several years' to develop. The first stage, in which helium was 'created' from hydrogen, was more a shot in the dark, although palladium was recognized as a catalyst.

At first, Paneth and Peters passed about 1 litre of hydrogen gas through a red-hot palladium capillary to "create" helium "spontaneously". But when they noticed that spectral lines of helium could be seen even when the capillary was at room temperature, they simplified their apparatus. They exposed hydrogen to a number of palladium preparations — a 'black', a

sponge or palladinized asbestos — for various periods of time. After twelve hours, enough helium was formed to show four or five spectral lines.

Paneth and Peters tried hard to account for possible errors in their method. For example, helium might have been trapped inside the palladium. They convinced themselves that this could not be so by repeatedly exposing their palladinized asbestos catalyst to hydrogen and oxygen. Only in the presence of hydrogen was helium released. Therefore, they concluded, the helium must have derived from hydrogen and not from an experimental artefact.

Unlike Pons and Fleischmann, Paneth and Peters did not observe the release of large amounts of heat from their apparatus. They write that they would have expected only a fraction of a calorie of heat to be produced by the creation of  $10^{-8}$  cubic centimetres of helium. Paneth and Peters conclude that the energy must be released in the form of radiation, but add that they had not detected it.

In April 1927, came the retraction. Paneth *et al.* had tested their results at Cornell University and in Berlin and drew the conclusion that they had "underestimated" two sources of error.

The first clue emerged during experiments designed to check whether helium could have diffused from the atmosphere through the glass walls of the apparatus. While performing numerous control studies, Paneth *et al.* found that glass heated in a hydrogen atmosphere yielded up absorbed helium, in amounts of about  $10^{-9}$  cubic centimetres, whereas glass heated in a vacuum yielded none. Helium detections at this level, they concluded, were to be discounted.

The second blow was the realization that the palladinized asbestos catalyst that had given the best results was, like glass, a considerable source of helium, which it released readily in the presence of hydrogen, but not in that of oxygen. In an almost self-mocking tone, Paneth *et al.* write that they must strike from their results all the trials with a palladinized asbestos catalyst, in which helium was 'created' in amounts up to  $10^{-7}$  cubic centimetres, and upon which they had earlier placed "particular value".

The story also has an addendum which parallels modern activities. In February 1927, John Tandberg of the Electrolux Research Laboratory filed for a Swedish patent on a device which produced "helium and useful energy". This invention was an electrolytic cell, using ordinary water, based on the work of Paneth and Peters but with a "significant increase in efficiency". The patent was never granted.

Steven Dickman

## Complicity alleged against physicist

### Munich

A Max-Planck Society physicist has been implicated in illegal exports to Pakistan of sensitive nuclear technology. Testimony given before a parliamentary committee in Bonn on 20 April revealed that the physicist, a prolific inventor who received a number of patents for himself and his employer, the Max-Planck Institute for Plasma Physics (IPP) in Garching, may be prosecuted for his involvement in the exports. He was dismissed from his post on 17 April when the institute's directors learned the extent of his involvement.

It had been known since December that Pakistan, South Africa and India had received nuclear technology from the West German companies NTG (Neue Technologien GmbH) and PTB (Physikalisch-Technische Beratung) without the necessary export licences having been issued by the West German government.

The physicist was also mentioned in the news as a consultant for NTG. But IPP defended him at the time, saying that his consulting work did not go beyond installing a tritium-removal apparatus using the so-called TROC process (Tritium Removal with Organic Compounds). TROC is used to remove tritium from glove boxes and other work areas. It cannot be used for the production or holding of the large amounts of tritium that can intensify the effect of a nuclear bomb. The physicist had developed TROC and IPP holds the patent on it.

But last week it emerged that the physicist also helped NTG install a "tritium handling system" for holding large amounts of tritium free from contamination. The use of this system for bomb production cannot be ruled out, though by itself it cannot produce tritium. The physicist did not inform IPP of his activities nor did he say that he had formed his own consulting firm.

The technology exported to South Africa and India could have been used only for peaceful purposes, said Hanau prosecutor Albert Farwick, who is handling the case against NTG, which is located in Gelnhausen, in the *Land* of Hesse. Pakistan denies that it broke West German export law.

The decision whether to prosecute the physicist will be reached by the autumn, said Farwick, who said that the physicist was "in no way the head" of the export operation. The case has generated some sympathy for the physicist, who is looked upon by some of his IPP colleagues as a "tragic case".

The physicist, who is estimated to have earned about DM50,000 for his work for NTG, is appealing against his dismissal by IPP. His case is expected to be heard in two weeks.

## SCIENCE POLICY

## Press pleads for more basic science

Washington

THE new US presidential science adviser D. Allan Bromley is "walking into a situation unparalleled in opportunity", according to US National Academy of Sciences president Frank Press, himself a presidential science adviser during the Carter presidency.

Bromley, Press said, will have a chance to accomplish real advances in the way the US science enterprise is financed and managed. Press, speaking in advance of his annual address to the members of the academy, said that the Bush administration's concern for maintaining US strengths in science and technology, coupled with the increased political power of the science advisory post, could make Bromley's tenure the most impressive in recent history.

Press's hints that the next few years may be a watershed for US science were borne out in perhaps the most sweeping of his yearly speeches to the members of the science academy. In marked contrast with last year's address (*Nature* 333, 1; 1988) in which he stressed the importance of setting priorities for science within the confines of a budget, Press called for doubling US spending on basic science over the next five years to \$20,000 million.

Press says that could be done by raising the growth rate of the basic science budget from 6 to 14 per cent per year, at a total cost to the United States of \$10,000 million. Such a hefty rise should be possible, says Press, if big expenditures are delayed until after the federal budget deficit is reduced.

To remove the barriers blocking the industrial benefits of such a large investment in science and technology, Press proposes the creation of a cabinet-level National Economic Security Council with the same powers over the high-technology economy that the National Security Council has over defence. His view is that the presidential science adviser would play a key role in directing the activities of the council.

Press also advocated a "national facilities act" to provide the infrastructure necessary for major science developments. The legislation would pay for refurbishing laboratories, instruments and equipment. Press estimates the equivalent of 50 new buildings could be had for \$1,250 million. Press also advocates the creation of 3,000 graduate fellowships in science and engineering, at a cost of \$3,000 million.

But Press's grand proposals may not be taken up as enthusiastically as he would wish by Congress and the Bush administration. President Reagan's stated goal to double the US National Science Foundation budget over five years has not yet been attained. But Press has the patience to wait: if his suggestions are not taken up this year, he plans to pursue them again in 1990.

Carol Ezzell

## Presidential adviser named

Boston & Washington

AFTER more than two months of delay and increasingly vocal protest from the scientific community, US President George Bush last week finally announced his choice of Yale University professor D. Allan

D. Allan Bromley, new science adviser.

Bromley for the post of presidential science adviser.

Bromley's appointment continues a tradition of favouring physicists for the post of adviser to the president and director of the Office of Science and Technology Policy. Bromley, who will be 63 next week, is Henry Ford II Professor of Physics and director of the A.W. Wright Nuclear Structure Laboratory at Yale University. He was born in Canada and has a high reputation in heavy-ion physics where he has been active in the development of accelerators, detectors and computer-based data collection and analysis systems.

Bush's failure to keep his promise to select a science adviser early in his administration had already prompted congressional protest by the time of the Bromley appointment. On 6 April, at a hearing of the Senate Labor and Human Resources Committee called by Senator Edward Kennedy (Democrat, Massachusetts), a series of witnesses, including Frank Press, president of the National Academy of Sciences, and two former science advisers, Donald Hornig and Guy Stever, expressed their disappointment that a science adviser had still not been appointed and that few of the 500 key federal administrative posts in science had been filled.

But Bromley says that Bush's campaign promise to upgrade the status of the science adviser is now to be fulfilled. Following "a discussion with the president" on 21 April, Bromley confirmed that "the new post will be the assistant to the president for science and technology. The science adviser will have direct access to the president and will be on the same level as the national security adviser [Brent Scowcroft].... This means that I will participate in meetings of the National Security Council, and I will be present at meetings that had not involved past science advisers." Bromley says he will not try to bring his own priorities to the

job but rather "sharpen options for the president" and "be part of the president's team". "Any science adviser who is perceived as a spokesperson for the scientific community is doomed to failure", he says. "The science adviser must be trusted in all detail by the president, must participate in policy debate, and be present in high-level decisions that have a relevance to science and technological matters." Numerous problems with a strong scientific component face the president, including the need for decisions on the Strategic Defense Initiative, the space station, the Superconducting Super Collider, the project to map the human genome, the space plane, and international action to counter global atmospheric change.

Even more difficult, because the choices are not clear, will be the setting of national policy to restore the United States' technological superiority and industrial competitiveness in the face of the growing strength of Japan and Western Europe. "This issue leads quickly to concern for education and training", says Bromley. "The questions of science and technology today are integrated across a whole spectrum of governmental affairs. It is very different from Eisenhower's day when the position was created. Now, agencies across the board are very sophisticated in their use of science and technology." So many agencies are now involved in science that some experts believe that a science adviser cannot hope to have much impact and that a new science organization is required. In testimony before Senator Kennedy, Donald Hornig, former adviser to President Lyndon Johnson, pointed out that the Office of Science and Technology Policy has never had much influence over the National Institutes of Health, with their \$7,000 million budget, nor over the Department of Defense, where two-thirds of the federal research and development budget (\$42,000 million) is spent.

The present science adviser, William Graham, claims to have spent much time nurturing inter-agency communication. But Graham's soft-spoken style gave him a reputation for near-invisibility. Colleagues of Bromley describe a man who is likely to act very differently, speaking of him as "emphatic", with new students initially "in awe of him".

Bromley directed former President Ronald Reagan's science and technology initiatives with India and Brazil and stresses the importance of international science. A key question, he says, is whether the United States should embark on huge projects "alone as a nation, or whether we should involve other countries".

Seth Shulman & Alun Anderson

# Gupta affirms authenticity

## New Delhi

PROFESSOR V.J. Gupta, of the Panjab University at Chandigarh, has angrily denied charges by Dr John Talent in last week's *Nature* (338, 613; 1989) that he invented fictitious fossils and had rewritten the geological history of the Himalayas through dubious publications. Gupta claimed that Talent's outburst was motivated by "a malicious intent to take revenge for personal rivalry and professional jealousy over the past 20 years".

Gupta did not specify Talent's motives for revenge, but implied that his interest in the Himalayas went beyond geology, and that the attack on him had something to do with information he was unable to provide to Talent. Gupta said his fossil collections came from Himalayan sites that were either militarily sensitive or close to international borders and thus not open to foreigners.

According to Gupta, Talent and his associates "wanted some information [about localities] which we cannot provide [for security reasons]". He said that Talent visited India 20 times "always entering from Pakistan", but says that he did not publish any paper on India. "I wonder which agency would finance a scientist for so many travels that result in no scientific output?" he asked.

On the authenticity of his fossils, Gupta says they were dug out by a team, not by him alone. To get them identified, expert opinions were sought from palaeontologists abroad. In some cases, opinions were contradictory, but "the diverse opinions were kept in view while working out the stratigraphic set-up of the area, taking account of the geological succession exposed in the field from where the fossils were collected". He said Talent was biased in his opinion about the ages of stratigraphic units.

Replying to the charge that his details of the localities at which his fossils were collected are distorted, Gupta said he had had to depend on old and inaccurate maps whose use is restricted by the government for security reasons. Gupta said his 25 years of work has documented the existence of Silurian-Devonian succession in the Himalayas and that "the truth about it will be proved by the progeny during the forthcoming years".

Predictably, the Talent-Gupta controversy has evoked a spate of comments from Indian scientists and hurried meetings at the Indian Geological Survey. Gupta's colleagues at the Centre for Advanced Study in Geology, including its director, Dr A.K. Prasad, described Talent's allegations as "a conspiracy to denigrate a top Indian scientist".

But the Society for Scientific Values (SSV) plans to launch its own investiga-

tion of the allegations. Describing them as "serious and undermining of Indian science", the society's president, Dr A.S. Paintal, said it will appoint an expert team to make an impartial evaluation of Gupta's work.

Contrary to Talent's implied remarks,

## CFCs

# Japan supports ban by the year 2000

## Tokyo

JAPAN will support a total ban on the use and production of chlorofluorocarbons (CFCs) by the year 2000, Japan's Environment Agency announced last week.

Japan's decision, to be formally announced next month in Helsinki at a meeting of signatories of the Montreal Protocol, follows similar pledges to end the use of CFCs made last month by the United States, the European Community and Canada (see *Nature* 338, 101; 1989). Japan's support will be important for the success of a total ban as it is one of the largest producers of CFCs, accounting for about 10 per cent of world production.

The Environment Agency has been keen to support revision of the Montreal Protocol and the announcement represents a victory over the powerful Ministry of International Trade and Industry (MITI). MITI is concerned that Japan's semiconductor industry may be seriously affected by a ban. Japan is the world's largest consumer of freon 113, the CFC used to clean semiconductors, and produces approximately 130,000 tonnes annually. Alternatives to

India does have a mechanism to check fraudulent research, said Paintal, who is also chief of the Indian Council of Medical Research. With a membership of over 120 reputable scientists, SSV was set up two years ago with the aim of improving the quality of science in India. So far, it has been concerned largely with allegations of misconduct in biomedical research.

K.S. Jayaraman

freon 113 are still in the early stages of development.

The machinations that led to the Environment Agency victory are unknown, but the words of an eminent foreign scientist and Japan's emperor may have helped.

Earlier this month, Frank Sherwood Rowland of the University of California, who was in Tokyo to receive the Japan Prize for his pioneering research on the link between CFCs and ozone depletion, repeatedly called for a worldwide ban. His appeals received wide media coverage.

At the presentation ceremony for the prize, the Emperor in a congratulatory speech noted that when CFCs were first synthesized for practical application, no one suspected that they would have such "dire consequences" he said that this should be a reminder that "science and technology need to be constantly monitored and appraised from newer and wider perspectives".

It is unusual for a Japanese emperor to make a public statement on such a politically sensitive subject. Following such a speech it would have been odd if Japan had not supported a ban.

David Swinbanks

## ANIMAL RIGHTS

# Anti-terrorism bill introduced in Senate

## Tucson

CONGRESSIONAL legislation that would make it a federal crime to steal or harm research animals or to break into and damage research facilities was introduced on 7 April in the US Senate.

Alabama Democrat Howell T. Heflin proposed the Animal Research Facility Protection Act of 1989 so that federal law enforcement agencies can become involved against what he said could be an international conspiracy.

During the next month, the Senate Committee on Agriculture, Nutrition and Forestry will review the bill, which will be an amendment to the Animal Welfare Act. Passage into law could take more than a year. The legislation also makes unauthorized entry into facilities and possession, control or duplication of records, data, material, equipment or animals a possible federal offence. Each violation could lead to a one-year prison sentence and a \$5,000 fine. The district court or magistrate could force the guilty party to

pay for damages and for reasonable cost of repeating ruined experiments. The research institution could also sue for damages.

The legislation also calls for the Secretary of Agriculture and the attorney general to assess the extent and effects of "domestic and international terrorism" on animal research, production and processing facilities. That survey would include places where animals are on exhibit or used in food production or as pets. A report would be due within a year.

Heflin said he had been working on the bill for several months at the insistence of the University of Alabama in Birmingham, but that a recent incident at the University of Arizona in Tucson (see *Nature* 338, 534; 1989) "acted as a catalyst to bring about a more rapid introduction than we had planned". In that incident, a group calling itself the Animal Liberation Front set fires in two university buildings, vandalized laboratories in two other buildings and took about 1,200 small animals.

Elizabeth Pennisi

## SCIENTIFIC MISCONDUCT

# New office gets going

## Washington

THE National Institutes of Health (NIH) Office of Scientific Integrity is changing from an administrative requirement into a reality. It has been given space on the crowded NIH campus, an acting director has been appointed and staff are being

assembled. But all this is happening despite threats from Congress that the office should be moved out of NIH to another agency that can be more objective about misconduct in biomedical research.

NIH and other federal agencies have been labouring hard over the past several months to find better ways of coping with scientific misconduct. Although few in the research community believe that the problem is widespread or growing, congressional and public interest has been fostered by several recent well-reported cases of alleged misconduct.

Earlier this year, the Public Health Service decided to create two new offices to deal with misconduct (see *Nature* 338, 588; 1989). The Office of Scientific Integrity in the office of the director of NIH will oversee — and conduct when necessary — misconduct investigations, recommend punishments and promote high standards of research conduct. The Office of Scientific Integrity Review will be in the office of the Assistant Secretary for Health of the Department of Health and Human Services, and will oversee the NIH office.

Brian Kimes, associate director for extramural programmes in the division of cancer biology and diagnosis at the National Cancer Institute, will become full-time acting director of the NIH office on 1 June, and will run the office on a part-time basis until then. Initially there will be a staff of eight, including two secretaries. Kimes expects that it will take about a year to clear the backlog of some 40 misconduct cases that are pending.

Although some cases will always take time to resolve, Kimes says a priority will be to speed up processing of the more routine cases. He also believes that as institutions receiving grants become more

adept at dealing with issues of misconduct — partly through experience and partly from guidance provided by NIH — fewer cases will require attention from NIH.

Kimes has had previous experience in misconduct, having participated in the investigation of Mark Spector, a graduate student at Cornell University. He says cutting-edge research that is somehow adulterated is easy to spot because many laboratories will quickly attempt to replicate it. Far harder to detect and punish is research that lies outside the main stream, published in journals that do not provide careful refereeing of submitted work.

Despite action by NIH, there still exists the possibility that legislation will be enacted to move the office out of NIH and into the office of the assistant secretary for health. Leslie Russell, a staff member of the powerful House of Representatives Energy and Commerce Committee, told an audience earlier this month, at a colloquium on science and technology of the American Association for the Advancement of Science, that such legislation will be introduced soon. Russell said NIH may face a conflict of interest in looking into misconduct research.

New regulations that spell out the responsibilities of federally funded institutions for investigating misconduct will be published in the near future. They are at present awaiting approval at the White House Office of Management and Budget.

Joseph Palca

## EUROPEAN COLLABORATION

# 25 years of ESA

## Paris

THE European Space Agency (ESA), whose headquarters are in Paris, last week added another birthday celebration to those of the Eiffel Tower and the French Revolution. It is now 25 years since European countries officially pooled resources to form the European Space Research Organisation (ESRO) and the European Launcher Development Organisation (ELDO). These merged in 1974 to become ESA (see page 718).

Helmut Kohl, the West German Chancellor, who was in Paris for a Franco-German summit, applauded ESA's success and invited the agency to promote its role in Earth observation, both to further efforts in pollution control and also to monitor progress in disarmament — a role its constitution probably excludes. French President François Mitterrand saw ESA as also a triumph for France, the biggest partner and principal driving force behind the commercial launch sector, Arianespace, as well as the transportation elements (Hermes and Ariane 5) of Europe's Columbus contribution to the US Freedom space station.

Nobel laureate Carlo Rubbia meanwhile reminded the distinguished gathering of scientists and diplomats from ESA's 13 member states that CERN (the European Laboratory for Particle Physics), ESA's 'elder brother' in Europe's family of large organizations, was established by some of the same scientists as was ESRO.

Peter Coles

## CHARITIES

# UK cancer fund finds new ways of making money

## London

THE Imperial Cancer Research Fund (ICRF), one of Britain's largest medical research charities, has substantially increased direct expenditure on research in the 1980s, by increasing its income and eating into its investment reserves. Next year, those reserves are expected to reach £14 million, the minimum desirable, and Sir Walter Bodmer, ICRF's scientific director, now says any new plans for expansion will have to wait for three to four years until income exceeds expenditure. In the annual report, published last week, the treasurer reports a 27 per cent increase in direct expenditure on research last year, which left income almost £7 million less than expenditure, a deficit met from reserves.

Increased income has come from a new initiative — charity shops. Since 1983, ICRF has set up 200 shops, which now bring in £4 million a year. By the late 1990s, the fund hopes to have 600 shops bringing in £16 million and to double income received from legacies to £72 million.

Major new projects under way include new laboratories at the Institute of Molecular Medicine in Oxford, for research into solid tumours; a new laboratory at the University of Cambridge for research into a vaccine for cervical cancer, by the ICRF's tumour virus group; and a new unit at the Institute of Psychiatry at Maudsley Hospital, London, to investigate smoking behaviour as well as examining the effects of passive smoking on children.

Expansion of the ICRF's main laboratories at Lincoln's Inn Fields, in central London, is also under way. A new building for administration and computing facilities will free space for 50 laboratory bays. Conversion into laboratories is due to begin in 1990 and will cost £3.3 million. Uncertainty about the funds that will be available could mean that completion will be slower than planned, a maximum of four years instead of three. But Bodmer says this development has top priority in the, and stresses that no existing commitments will be cut to meet costs of this expansion.

Christine McGourty

## Democracy finally wins

Moscow

ON 20 April, the Soviet Academy of Sciences finally elected its quota of deputies to the country's new parliament, bringing to an end the four-month election campaign to the Congress of People's Deputies that will form the Soviet parliament.

Members of the Soviet Academy had wanted to be represented by socially orientated legislators, people with radical reform programmes in their pockets, who would firmly and boldly struggle against the administrative and command system, rather than talking about *perestroika*.

The election procedure in this public organization has evoked much interest both in the Soviet Union and abroad. In March, the academy's election conference annulled the decision of the extended plenum of the academy's leadership, held last January, to nominate 23 candidates for 20 vacancies and to ignore a long list of names advanced by numerous academic institutes. Then, only eight candidates won the necessary number of votes (at least one more than the number entitled to vote), while the other 12 seats remained vacant. This triggered the legal requirement for the follow-up elections.

The academy's leadership learned the lesson. They took into account proposals advanced by academic institutes, invited the press and the pressure group called "For Democratic Elections in the Soviet Academy". Voting by a show of hands, they nominated 25 candidates for 12 seats. (On the last day before the vote, the well-known Soviet economist, Academician

Stanislav Shatalin, withdrew from the elections for health reasons.)

The election conference was attended by 1,101 voters, including Soviet academicians, non-voting members of the academy and 433 representatives of academic institutes. The voting was preceded by heated debates: all candidates presented their political, social and legal programmes and answered scores of tough questions about the most pressing issues of *perestroika*.

The support of grass-roots organizations proved decisive. Those elected were, among academicians, Andrei Sakharov, Roald Sagdeev, Vitaly Ginzburg and Georgy Arbatov and, among non-voting members of the academy, Sergei Averintsev, Pavel Bunich and Nikolai Petrakov. Other successful candidates were doctors of economics Nikolai Shmelev and Gennadi Lisichkin, both well-known authors of strongly worded articles; Dr Alexander Yakovlev, a lawyer; Yuri Kariakin, head research worker of the Institute of the International Labour Movement; and Dr Viacheslav Ivanov, a philologist.

On balance, the Soviet Academy of Sciences has passed its examination in democracy with flying colours. Undoubtedly, its deputies to the Soviet Parliament as well as scientists elected from other public organizations, territorial and national-territorial districts, will represent a powerful group working to speed up the radical restructuring of domestic and foreign policies.

### NUCLEAR REACTORS

## Superphénix go-ahead

Paris

Superphénix, the French fast-breeder reactor, has been given the go-ahead to begin generating electricity again after a two-year interruption while a structural fault was investigated. Earlier this year, the reactor was restarted without its leaky fuel-rod transit chamber, despite protests from environmental groups in neighbouring Switzerland who want the plant to be closed down.

Following trials without producing electricity, the French nuclear safety authorities are satisfied that the generator can resume full-power output (1,200 MW) within the next two months. But environmental groups are outraged that no independent inquiry has been carried out and say that to restart the generator without the transit chamber will leave the plant with no safe site to allow fuel rods to cool in the event of an accident. A new transit system for fuel rods is being installed and will be ready for the autumn.

Peter Coles

### AIDS

## Controversial visa ban

Washington

The US policy of denying entry visas to foreigners infected with the human immunodeficiency virus, the virus which causes AIDS, may become a contentious issue before next year's international AIDS conference, scheduled to take place in San Francisco, California. Several researchers are expected to introduce a resolution at this year's conference in Montreal, Canada to move the 1990 conference to a country that does not screen travellers for HIV infection.

The United States passed a law two years ago prohibiting immigrants and aliens infected with HIV from routinely entering the country. Several US congressmen have said that the intent of the law was to turn away HIV-infected immigrants seeking permanent residence, but the law recently was invoked to detain a Dutch city official with AIDS who was travelling to the United States for a health conference.

Carol Ezzell

## Test flight of IRBM abandoned after postponements

New Delhi

INDIA'S eagerly awaited test flight of its first intermediate-range ballistic missile (IRBM) did not take place on 20 April as scheduled, disappointing dignitaries including the defence minister and the three service chiefs who had come to witness the launch from Chandipur in coastal Orissa state. The launch time was postponed three times and late in the afternoon the Defence Research Development Organisation (DRDO), which developed the missile, announced that the test had been put off indefinitely. No reasons were given, although unofficial reports said the mission was aborted because of technical problems.

The two-stage, 100-tonne missile named Agni is said to have a range of 2,500 km and to be able to deliver a warhead weighing more than a tonne. Except for the inertial navigation system, for which France provided help, the missile is claimed to be fully indigenous. The first stage is solid-fuelled for quick acceleration and the second is propelled by a storable liquid of very high specific impulse.

Although not officially stated, the main aim of the launch was to evaluate the performance of the heat shield — an important piece of hardware in a weapon delivery system — during its re-entry through the atmosphere.

The missile, in fact, had been named after this important mission objective (*agni* means fire in Sanskrit). Although DRDO had developed the heat shield some time ago, its testing had to wait until Agni was ready.

After Trishul and Prithvi, Agni is the third missile to roll out of the DRDO laboratories in Hyderabad. Trishul is a short-range (12-km) surface-to-surface missile.

The postponement of the IRBM launch after much publicity is a setback to DRDO which had hoped to score over Pakistan's recent success with its HATF-2 missile, which brings Bombay and Delhi within range. Prithvi, DRDO's long-range surface-to-surface missile, has a range of just 250 km. It has yet to enter the production phase.

DRDO would have launched Agni secretly had there been no population near the test range. As it turned out, opposition by some 12,000 villagers to mass evacuation from their homes in the safety zone brought the event under the glare of national and international publicity. Meanwhile, DRDO has not given any indication of when it will fire Agni next.

## INTERNATIONAL RESEARCH

# Hitachi opens new labs

## Tokyo

HITACHI Ltd of Japan last week announced the opening of four research laboratories in the United States and Europe that will form close ties with nearby universities. Hitachi's move is the latest in a series of steps by Japan's industrial giants to form links with universities in the West, and it has raised fears that Japan is trying to tap the brains of Western academic institutions. But university researchers involved in the collaboration see the joint research as mutually beneficial.

Hitachi's new laboratories, which will open within the next few months, will be in the Cavendish Laboratory of the University of Cambridge in the United Kingdom, the O'Reilly Institute of Trinity College at the University of Dublin in Ireland, and within Hitachi America Ltd at San Francisco and Detroit in the United States. The arrangement with the University of Cambridge is particularly novel.

The Cavendish Laboratory, one of the world's leading research institutes with a string of Nobel prizewinners to its name, has been desperately seeking funds for a new building for its microelectronic researchers who are currently housed on a separate site at the Science Park in Cambridge. The lease on their building in the park runs out in September and cannot be renewed, according to Dr H. Ahmed, head of the microelectronics laboratory.

Unable to get support from the government, the university has had to dig into its trust funds and turn to Hitachi and another Japanese company for help. Hitachi has donated £250,000, or nearly a third of the £800,000 needed for construction of the building, and Japan's Toshiba Corporation has also given £50,000, says John Deakin, secretary of the Cavendish Laboratory. Construction is expected to be completed in December.

Toshiba's donation is not unusual. Many companies, for example Britain's Rolls-Royce, have contributed to research at the University of Cambridge. What is unusual is that, in return for its large donation, Hitachi will gain control of about a quarter of the new building with its own private entrance.

Hitachi will set up joint research projects with University of Cambridge researchers. The first couple of Hitachi researchers will arrive in May and will collaborate with Ahmed and one of his students on the computer simulation of future microelectronic devices. When the new building opens in December, Hitachi will increase its laboratory staff to about ten, including several British researchers, and the company will pump in annual research funds of about ¥200-250 million (about £1 million), says Hitachi vice president Hiroshi Watanabe. The research

centres in Ireland and the United States will be of similar size. And within about ten years, Watanabe hopes to expand the total number of researchers in Europe and the United States to about 200, dispersed among small laboratories of 10-20 researchers, with most of the staff recruited locally.

Hitachi is just one of several Japanese companies that have recently established research centres linked to universities in the West. Other examples include NEC Corporation, which will open a laboratory in Princeton, New Jersey next month that will carry out joint research on information technology, such as automatic translation machines, with Princeton University. Kobe Steel Ltd opened a polymer composites research laboratory at the University of Surrey in the United Kingdom last October. And Hitachi Chemical will use two-thirds of the space in a new biotechnology laboratory of the University of California in exchange for a \$12 million donation.

Many Japanese companies have for

several years been making donations to leading US universities, for example through the endowment of university chairs. But the move to establish joint research centres is a new phenomenon and there are fears in the West that it is an attempt by Japanese companies to pick the brains of the Western world.

Ahmed, however, sees the collaboration in quite a different light. Japan leads the world in much of the research and development of microelectronics. As well as Hitachi gaining access to the University of Cambridge, Ahmed's student will spend six months in Hitachi's Central Research Laboratory in the outskirts of Tokyo which is equipped with one of the finest clean rooms in the world.

Hitachi's local subsidiary will retain patent rights to all joint research carried out with the University of Cambridge. But the Cavendish Laboratory will get "about 50 per cent" of patent royalties under its agreement with Hitachi, says Deakin. And both Deakin and Ahmed are confident that the university will gain both financially and academically from its collaboration with the Japanese company.

## MARINE SCIENCE

# Australia to seize the seas?

## Sydney

A NEW report on Australia's marine industries recommends a radical reorganization of the nation's marine science and technology capabilities and calls for Australia to claim its Exclusive Economic Zone, an area bigger than its land mass. But the federal Department of Science appears to be in no hurry to submit to cabinet the report's recommendations, which would cost A\$11.7 million to put into effect. The full report will be made public shortly.

Increasing interest by foreign governments in Australia's fishing zones, the growth in visitors to the Great Barrier Reef and the potential of off-shore oil and gas prompted the government last year to convene a committee chaired by Professor Ken McKinnon, vice-chancellor of Wollongong University.

Marine industries are at present worth more than A\$16,000 million annually, of which A\$4,500 million is gross export income. The federal government spends A\$70 million a year on marine research and development but there has been no growth for four years.

In line with the government's view that industry should help pay for the development of technology, the report recommends upgrading of areas such as aquaculture, marine biotechnology and seabed mineral assessment. "The picture which emerges is that our efforts in the marine field are unbalanced. A large proportion

is concentrated on marine biology and too little in the physical sciences and technology. There are vast amounts of money to be made in marine technology fields, the incentive for industry is untapped profit", McKinnon said.

The report says that previously unharvested species of fish could be exploited in Australia's Exclusive Economic Zone and calls for a personal levy on tourists visiting the Great Barrier Reef "to help maintain the reef in its original state". The committee proposed the formation of a statutory Australian Marine Industries and Sciences Council (AMISC) with responsibility for policy, planning and funding. Eighteen different government departments have an interest in marine sciences, according to the report, so there is likely to be disagreement as to which should take responsibility.

Joe Baker, director of the Australian Institute of Marine Science (AIMS), welcomed the recommendations. "Overall the report brings together data that has been, until now, scattered. We recognize that there must be the incentive for industry to invest in the marine environment and we recognize that, ultimately, AIMS, together with the oceanography and fishing divisions of the Commonwealth Scientific and Industrial Research Organisation and some components of the Bureau of Meteorology and the Antarctic Division will have to be incorporated into a larger structure."

## Theory versus practice

SIR—As a mere data-generator, I am no doubt ill-equipped to follow the deep theoretical meditations of Virginia A. Huszagh and Juan P. Infante ("The hypothetical way of progress"; *Nature* 338, 109; 1989), far less to criticize them. I am, apparently, caught up in a labyrinth of authoritarian ideology, stale paradigms and pseudo-hypotheses; nor is there anyone who could show me the way out of this maze, as all the creative minds have been driven off, and my fellow-prisoners are mediocre imitators who are unable even to make simple distinctions between speculation and theory. As a wretched product of such a dismal environment, shall I be forgiven for advancing the non-scientific and sociologically based view that this was one of the most inane pieces to be published in *Nature* in many months?

CHARLES JENNINGS

Department of Biochemistry and  
Molecular Biology,  
Harvard University,  
7 Divinity Avenue, Cambridge,  
Massachusetts 02138, USA

SIR—Huszagh and Infante make several valid points in their plea for more encouragement for theoretical papers in biology. However, as the editor of a journal (*BioSystems*) which receives (and encourages) theoretical contributions, I take exception to the generalization that journals and reviewers tend to dismiss theoretical work out of hand. As Huszagh and Infante themselves acknowledge, there is much *pseudo*-theorizing, and the overall rejection rate in this area is probably justifiably high. More might be done to stimulate interactions between theoreticians and experimentalists by broadening our overspecialized science curricula, rather than by awarding grants.

ALAN W. SCHWARTZ

Laboratory for Exobiology,  
Faculty of Science,  
University of Nijmegen,  
Toernooiveld 6525 ED,  
Nijmegen, The Netherlands

SIR—It is with great interest and an immense sense of relief that we read the Commentary by Huszagh and Infante. The authors echo our own fears and experiences as PhD students. A PhD thesis seems meant solely to be a repository of unwieldy data — and data that conforms with the literature at that.

Things are not very different at seminars. Research data are presented and a particular explanation is offered where two or more possibilities might coexist and they are all dismissed on the grounds that "such examples are not found in the literature". Does the past trend of results govern the future course of science?

It is of course man's ability to think that changes the course of science, not the mere compilation and arrangement of data. Albert Einstein said: "... it appeared that it was possible to get certain knowledge of the objects of experience by means of pure thinking ... Nevertheless, for anyone who experiences it for the first time, it is marvellous enough that man is capable at all to reach such degree of certainty and purity in pure thinking as the Greeks showed for the first time to be possible in geometry".

## New kidneys

SIR—The leading article (*Nature* 337, 393; 1989) about replacement kidneys reaches a conclusion with which few would disagree, namely that better international arrangements are need for collecting, matching and delivering kidneys to where people need them. In reaching this conclusion, the writer cites two reasons why a commerce in replacement organs should not be unthinkingly banned.

It would be imprudent to ban any practice unthinkingly, but if it is accepted (perhaps naively) that the role of the state is to ensure the well-being of its people, the first reason, as exemplified by the case of a parent who sells an organ in order to provide proper care for a handicapped child, becomes less compelling. An indigent parent is naturally willing enough to do all in his or her power to help a handicapped child, but society should not require that such a parent be exploited by the organ trade. The second reason given is that a law aiming to ban a commerce in replacement organs is unlikely to be effective. Similar objections were probably raised to laws against the slave trade. Admittedly, it is quite possible to draft an ineffective law, but much more frequently it is the enforcement of a law that is ineffective because enforcement depends to a large extent upon political will.

We are then left to consider the morality of a commerce in replacement organs. Commerce implies profit and an indigent who sells an organ is unlikely to profit from the sale. I do not know of any study of the longevity of organ donors, but it is possible that donation may adversely affect the life expectancy of a donor. If loss of life expectancy occurs during the earning period of a vendor's life, the profit from an organ sale that accrues in the long term to a seller is apt to be minimal.

There is reason to believe that a signifi-

cant part of the profit from the sale of a replacement organ ends up not with the person who is the source of that organ but with the entrepreneur who arranges the deal. While the donation of an organ is an act greatly to be admired, reason requires that an exploitive commerce in replacement organs be speedily proscribed by internationally accepted and enforced legislation.

## Apoptosis or apoptomeatic

SIR—The use of the word 'apoptosis' to describe the active death of a cell is not new. The term is first attributable to a poet, Dioscoriades, who used it in the first century to describe the seasonal falling of flowers<sup>1</sup>. The Greek medical authors Hippocrates and Galen use the word to denote hair loss in balding gentlemen, or the weakening of bones with age. All these events could be caused by an active, programmed cellular response. Greater artistic licence was taken in the second century, with Esais, another Greek poet, using 'apoptosis' to refer to 'falling by the wayside' or 'backsliding' in a theological sense<sup>2</sup>. This is presumably the origin of the definition located by Kleine<sup>3</sup>. Modern English dictionaries do not list the word, but contemporary medical ones do; they dissect it into 'apo' for 'head' and 'ptosis' 'to fall', with particular reference to balding. This may be an artificial division, but the exact origins of the term are unclear.

The 'apoptotic' T lymphocyte is something of a linguistic menagerie. 'Lympho' is derived from 'limpa', a Latin word for 'clear water', the 'p' being corrupted through Greek influence to 'ph' (just as the nypae became the nymphae). 'Cyte' on the other hand is a true Greek word meaning 'hollow vessel'. Clearly the process of activated cell death deserves accurate description: an alternative Greek word is 'apoptomeatic', this being an 'unlucky chance' or 'loss' as used by the authors Polybius<sup>4</sup> and Athaneus<sup>5</sup>. However, as it is not mere fortune but instead a specific antibody that initiates cell death, as described by Smith *et al.*<sup>6</sup>, 'apoptosis' remains the more reasonable alternative. Perhaps 'apoptosis' should join the growing list of scientific terms for review in standard English dictionaries.

# The making of modern chemistry

George B. Kauffman

Two hundred years ago Lavoisier's *Traité élémentaire de chimie* was published in Paris. The book stands alongside Newton's *Principia* as a landmark work in science.

"CHEMISTRY is a French science. It was founded by Lavoisier of immortal fame". Although many would argue with the French chemist Charles-Adolphe Wurtz's chauvinistic, exaggerated characterization of chemistry, few would dispute his characterization of Antoine-Laurent Lavoisier (1743–1794) as the founder of the subject in its modern form. Lavoisier himself was aware of the revolutionary nature of his work. On February 20, 1773, in opening a new research notebook — the first of his celebrated *registres de laboratoire* — he announced:

Before commencing the long series of experiments that I propose to make on the elastic fluid which is released from bodies, whether by fermentation, or distillation, or finally by every combination, as well as on the air absorbed in the combustion of a great number of substances, I believe that I ought to put some reflections here in writing, in order to shape for myself the plan which I must follow. . . . The importance of the objective impels me to repeat all that to me seems suitable to bring about a revolution in chemistry and physics<sup>1</sup>.

The spread of Lavoisier's revolutionary doctrines was helped by his classic *Traité élémentaire de chimie*<sup>2</sup>, which was published two hundred years ago and represents the culmination of his life's work. When Lavoisier began chemical research, the aristotelian four-element theory was still widely accepted. According to the theory, all substances were composed of four elements — earth, air, fire and water — in varying proportions, and could be transmuted into one another by changing the proportions. In his *Sceptical Chymist* (1661) Robert Boyle had criticized both this theory and the three-principle (mercury, sulphur and salt) theory of the Arabs and Paracelsus; Boyle suggested that an element was a substance that could not be decomposed any further, but his views were not widely held.

Chemistry was first systematically ordered in the late seventeenth and early eighteenth centuries by Georg Ernst Stahl, who developed the phlogiston theory from his teacher Johann Joachim Becher's concept of 'fatty earth', the element of inflammability. Unlike the four-element and three-principle theories, this theory, which held sway until the ideas embodied in the *Traité* were accepted, explained not only chemical composition but also chemical reactions and processes. All combustible substances were considered to contain the hypothetical princi-

ple of phlogiston, the word being derived from the aristotelian term for fire element. Theoretically, phlogiston was released during combustion in the form of fire, flame and sometimes light. The same idea was applied to the process of calcination (or rusting) of metals:

## Phlogiston

Metal – phlogiston = calx

Calx + phlogiston = metal

## Lavoisier

Metal + oxygen = metal oxide  
(oxidation)

Metal oxide – oxygen = metal  
(reduction)

On 1 November 1772 Lavoisier deposited with the Académie des Sciences a sealed note (*pli cacheté*) describing his initial experiments on combustion, the first steps towards his 'revolution in chemistry'. In it he reported that, on burning, sulphur and phosphorus did not lose weight (as might be expected from a loss of phlogiston), but instead increased in weight because they absorbed "a prodigious quantity of air"; while litharge (PbO), in forming lead by reduction with charcoal, did not gain weight (as might be expected from a gain of phlogiston) but decreased in weight because it had lost "air". He did not explain the exact nature of the "airs". It was only after Joseph Priestley's discovery of "dephlogisticated air" (oxygen) in 1774 that Lavoisier realized that in combustion and calcination only a portion of the common air was used up; he decided that Priestley's newly

discovered "air" was what was absorbed ("vital air"), and that "nonvital air" or "azote" (nitrogen) was what remained. Lavoisier concluded that air was a mixture of two different "elastic fluids" — one that supported combustion and respiration (the "salubrious part") and one that did not (*Mém. Acad. R. Sci.* 351–367, 1774). He later called the active part of the air "eminently respirable air", and he demonstrated that "fixed air" (CO<sub>2</sub>) was a compound of charcoal with this air (*ibid.* 520–526; 1775).

In a series of memoirs Lavoisier showed that "eminently respirable air" was contained in phosphoric (H<sub>3</sub>PO<sub>4</sub>), vitriolic (H<sub>2</sub>SO<sub>4</sub>) and nitrous (modern, nitric, HNO<sub>3</sub>) acids, and that it combined with non-metals to form acids. He therefore renamed it *principe acidifiant* or *principe oxygène* from the Greek terms for 'acid' and 'to beget' (*ibid.* 535–547; 1778); this name held even after 1810, when Sir Humphry Davy showed that hydrogen, not oxygen, was the essential constituent of acids. During the winter of 1782–1783, Lavoisier, together with the mathematician Pierre-Simon de Laplace, invented the first ice calorimeter, with which they measured the heat generated in various chemical and physiological reactions, thus establishing the fields of thermochemistry and physiological chemistry. This research led them to conclude that respiration was a kind of combustion. Lavoisier now began to attack the phlogiston theory (*ibid.* 592–600; 1777) and maintained that combustion and calcination were combi-

Lavoisier at work investigating the phenomenon of respiration. The scene was depicted by his wife, a talented woman, who also drew the copperplate illustrations which adorn the *Traité*.

nations with oxygen rather than decompositions (loss of phlogiston).

In 1783 the Englishman Henry Cavendish obtained water by burning "inflammable air" (hydrogen) in common air and in "dephlogisticated air", but he assumed that the water was originally present as a constituent of both "airs". Lavoisier repeated Cavendish's experiment quantitatively, and on 12 November 1783 he made the historic announcement to the Académie des Sciences that water, previously considered one of the four elements, was a compound of "dephlogisticated air" and the aqueous inflammable principle (*principe inflammable aqueux*) (*Observations sur la physique* 23, 452–455; 1783). This work led to the experiments on the combustion of alcohol and other organic compounds in oxygen, which represent the beginnings of quantitative organic analysis.

Lavoisier's new antiphlogistic theory of combustion slowly gained adherents. Beginning in 1782 Louis Bernard Guyton de Morveau, Claude Louis Berthollet, Antoine François de Fourcroy and Lavoisier collaborated in devising a new system of nomenclature, based on the new chemistry, which led in 1787 to the *Méthode de nomenclature chimique*<sup>1</sup>. This influential book listed provisionally as elements 55 substances that had not been decomposed (*substances non décomposées*). The system marked a complete break with the past and replaced the old fanciful names such as butter of antimony, oil of tartar, spirit of hartshorn and so on by new ones that corresponded to their chemical composition. With some modifications, the new names form the basis for our modern system of nomenclature.

The *Traité élémentaire de chimie* grew out of the *Méthode* and was published in March 1789. It was neither a general reference work nor a technical monograph, but a book for beginners which summarized the discoveries of Lavoisier and his co-workers and which introduced the new chemistry. In the preface Lavoisier described his pedagogical ideas on the learning of science, the new nomenclature and his reliance on experiment:

We must trust to nothing but facts: These are presented to us by Nature, and cannot deceive. We ought, in every instance, to submit our reasoning to the test of experiment, and never to search for truth but by the natural road of experiment and observation.

He rejected the four aristotelian elements and the three paracelsian principles, and he admitted the provisional nature of his own table of elements, which he called *substances simples*:

We cannot be certain that what we regard today as simple is really so; all that we can say is that such a substance is the actual limit reached by chemical analysis, and that, in the present state of our knowledge, it cannot be further subdivided.

The first edition of the *Traité* was published in two volumes, continuously paginated and divided into three parts. In Lavoisier's own words:

In the first part of my work, I make very little use of any experiments but those which were made by myself. . . . The second part is composed chiefly of tables of the nomenclature of the neutral salts. To these I have only added general explanations, the object of which was to point out the most simple processes for obtaining the different kinds of known acids. This part contains nothing which I can call my own, and presents only a very short abridgement of the results of these processes, extracted from the works of different authors. . . . In the third part, I have given a description, in detail, of all the operations connected with modern chemistry . . . this part could not be borrowed

from any other work, and. . . in the principal articles it contains, I could not derive assistance from anything but the experiments which I have made myself.

In Chapter XIII (Part I) Lavoisier reported a hitherto unpublished quantitative experiment, stating most clearly the law of conservation of matter during chemical reactions:

Nothing is created either in the operations of the laboratory, or in those of nature, and one can affirm as an axiom that, in every operation, there is an equal quantity of matter before and after the operation; that the quality and quantity of the principles are the same, and that there are only alterations and modifications. On this axiom is founded the whole art of making experiments in chemistry: we must suppose in all of them a true equality or equation between the principles of the body one examines, and those that we extract by analysis.

Actually, the idea that matter is neither created nor destroyed originated with the Greek atomists and was commonly assumed by eighteenth-century scientists.

Lavoisier, however, was the first to apply it specifically to chemical reactions. The historian of chemistry, John Riddick Partington, also considered this the first use of the word 'equation' in the sense of chemical equation. In Lavoisier's words, "must of grapes = carbonic acid + alcohol". Ironically, in this case Lavoisier's data contained considerable errors, yet they largely cancelled each other out and yielded a result close to equality.

Part II, the shortest part, includes a "Table of Simple Substances", a modified version of the *Méthode de nomenclature chimique* and the first modern list of the chemical elements. Part III, almost half of the book, deals with a wide variety of techniques and apparatus. Altogether the *Traité* is a truly modern work — in Douglas McKie's words, "Lavoisier had done for chemistry what Newton had done for mechanics a century earlier in his *Principia*".

As a political liberal who sympathized with many of the criticisms against the *ancien régime*, Lavoisier took part in the events leading to the French Revolution. Nevertheless, he was attacked by the radical politician and journalist Jean-Paul Marat. In 1768, Lavoisier had become a member of the Ferme Générale, the government's primary tax-collecting agency, and during the Reign of Terror, the Revolutionary Convention passed a decree on 24 November 1793 ordering the arrest of the former members of the agency (which had been abolished in 1791). On the morning of 8 May 1794, together with 27 of his former colleagues, including his father-in-law, Lavoisier was tried and convicted by the Revolutionary Tribunal. All were guillotined that very afternoon. The widely circulated remark, "The Republic has no need of scientists; let Justice take its course!", attributed to Jean Coffinhal, president of the Tribunal, is apocryphal. But the comment made the following day by Joseph Louis Lagrange is authentic — "It took them only an instant to cut off that head, and a hundred years may not produce another like it". □

# Reproducible Success!

The new  
Thermocycler  
from Braun is  
"high-tech", because ...

*it automates all labour-intensive,  
repetitive temperature control routines  
in the laboratory which require rapid  
temperature changes and high  
reproducibility.*

## Some of the advantages:

- High sample capacity
- Robust instrument for permanent use in routine and research
- Free selection of process parameters by means of integrated computer system
- Computer-guided process control with integrated error messages
- Amortization of instrument within one year of routine use

*But the Thermocycler offers more than that!  
Go and see for yourself! Just phone for  
information!*

**Dr. Asche, Telephone FRG (56 61) 71-39 43,**  
will be pleased to help you.

# MINIMIZE VARIABLES

# MAXIMIZE RESULTS

For Research Use Only

## Only Oncor Offers You The Total Non-Isotopic System

From start to finish, every component of the total Oncor® Non-Isotopic System is carefully designed to work together to create bright, clear, sensitive nucleic acid blots.

### Probe it your way

Start with our prelabeled biotinylated probes and markers. Or, select our probe labelling kit and get every enzyme, control, and buffer you need to confidently label your own.

### Hybridize and detect

Our second Oncor kit gives you every reagent, enzyme, and dye you need to block, hybridize, wash, stain, and detect your nucleic acids. The entire protocol

is proven and easy to follow.

This kit includes the exclusive Oncor nylon membrane, positively charged for high binding capacity. Coupled with our reagents, this membrane gives you sharp, clean bands with very low background. You get rapid signal development, with sensitivity down to 0.18 pg.

### Cover it all

With our accessory kit, you get all the bags and trays you need to optimize each hybridization and washing step.

Oncor also offers a stripping kit so you can strip and reprobe a single sample without loss of sensitivity.

Don't settle for piecemeal analysis. Look to the total Oncor non-isotopic system for optimum results, time and time again.

### Maximize Today

## More News From Oncor

### Electrophoresis And Transfer In One Unit

A revolutionary new system for nucleic acid fragment sizing is the industry's first integrated reagent and instrumentation system to combine gel electrophoresis and transfer in one unit.

The patented Oncor® Probe Tech™ instrument, in combination with Oncor Southern hybridization reagents and probes, will allow clinical laboratories to take advantage of diagnostic tests requiring identification of DNA and RNA fragment sizes.

The combination of this unique instrumentation system and advanced reagent chemistry reduces what was previously a one to two day processing time to six hours.

Nucleic acid fragment sizing is a critical determinant in the analyses of cancer diagnostics such as B/T cell gene rearrangement tests for leukemia and lymphomas, genetic disorders and other diseases targeted in the emerging field of molecular diagnostics.

#### Patented Technology

Oncor researchers developed the patented technology used in Probe Tech. This advanced system allows basic and clinical investigators to conduct fragment sizing with sufficient reproducibility and accuracy to permit standardized testing. Tests confirm that fragments from 0.1 to 25K base pairs are detected with Probe Tech. The compact, three square foot instrument contains two cartridges designed to combine accelerated electrophoresis, gel conditioning and transfer of nucleic acid fragments. This innovation minimizes gel handling and eliminates the additional equipment and time required in conventional procedures.

#### Consistent Performance

The Oncor system assures consistent performance. Included in the system are extraction reagents, restriction enzymes, separation gels, nylon hybridization membranes and hybridization probes. All components have been tested and qualified on human DNA in the company's molecular pathology laboratory.

### UV/Camera System

The new Oncor® UV/Camera System is the only portable nucleic acid photo-documentation system to combine a UV light source and camera into a single unit.

The UV/Camera system allows for Polaroid instant film photography of nucleic acid separations in gels right at the lab bench; no darkroom or separate UV transilluminator is necessary. Most other systems have a separate light source, camera stand, camera and focusing bellows.

The system houses an overhead UV light source to activate fluorescent dyes. Since gels are exposed to UV light from above, in a self-contained unit, protective eyewear is not needed.

The unique design allows gels to be photographed in place. Less gel manipulation saves time, minimizes handling and avoids damage to fragile gels.

The portable UV/Camera is light weight, compact and easy to store. It can be used with the Oncor Probe Tech™ Electrophoresis and Transfer Systems or to photograph any gel 14 x 11 cm or smaller.

### Non-Organic DNA Extraction Kit

The new Oncor® Non-Organic DNA Extraction Kit produces high-purity, high-yield DNA in four hours without the use of hazardous organic chemicals.

Oncor provides the only complete kit that contains all reagents necessary for the non-organic extraction of DNA. Reagents are qualified on human samples. This assures consistent results, and high DNA yield with purity equivalent to phenol extraction. The absorbance ratio is  $A_{260}/A_{280} = 1.75-1.90$ .

By eliminating multiple extraction steps—no dialysis or DNA concentration steps are required—the Oncor Non-Organic Kit extracts DNA with fewer manipulations in half the time. The procedure that formerly could take up to three days can now be completed in four hours.

Samples taken from any mammalian cell—whole blood, bone marrow, body fluids, tissue culture, or solid tissues—can be used.

The cells are lysed and deproteinated using protein digesting enzymes to remove contaminating cytoplasmic and nuclear proteins. The harvested chromosomal DNA is precipitated with ethanol, resuspended and then quantified using a spectrophotometer.

Non-Organic reagents used in the Oncor kit are safe, non-caustic and noncarcinogenic. They can be discarded down laboratory drains, eliminating the need for hazardous waste storage containers and fume hoods.

# What to say about cold fusion

Public interest in recent excitements is to be welcomed, especially if it does not turn to anger when attempts to replicate the observation of cold fusion fail — the most probable outcome.

FLEISCHMANN and Pons have done at least one great service for the common cause: they have kindled public curiosity in science to a degree unknown since the Apollo landings on the Moon. In the past few weeks, people thought by those about them to have a few scraps of inside knowledge have been quizzed about the smallest details of the experiments at the University of Utah — those first described in the *Wall Street Journal* and the *Financial Times* on 23 March and at a press conference at Salt Lake City later that same day. The social phenomenon is all the more remarkable because of the wide distribution of those who have a general understanding of nuclear fusion and of the reasons why its practical application would be important.

These impromptu conversations seem generally to be remarkably good-humoured. Those who want to know more, and who in particular ask "Do you think it's true?", seem not too much annoyed by the prospect of continued suspense. It is remarkable that so many people are willing to accept that experimental observations, and the inferences drawn from them, acquire validity only by replication. Has what used to be called "the scientific method" now become widely understood?

If so, much of the credit should go to the daily press, which has risen superbly to the challenge of cold fusion. The two financial newspapers that broke the news on 23 March did so in cautious language, making it plain that cold fusion was not then a proven reality, let alone a commercial source of limitless energy. Other daily newspapers have joined in with commendable zeal and sobriety. Inevitably, the US daily press, with its resources and self-discipline, has done best, but newspapers such as the London *Daily Telegraph*, with no great tradition in the field of science reporting, have been magnificent. Reporters have given full and coherent accounts of meetings as far apart as Sicily and Texas, have canvassed opinions with care and have also faithfully reflected the good humour of these hectic weeks.

The good humour may not persist if the experiments cannot be replicated but there are some grounds for optimism. Part of the reason why so many people are so interested seems to be the general delight that a couple of people in widely separated universities have used their own money to pull off a trick on which governments have

lavished huge sums of money in the past 30 years, so far without result. So people may well be indulgent if the attempts to replicate cold fusion on the scale described by Fleischmann and Pons prove failures. "It was a brave venture", they may say, "What a pity it did not succeed!"

That would be the best outcome. It is also, of course, possible that the general reaction to the failure of attempts at replication will be more sour. The scientific community's reputation is vulnerable in several respects, not the least of which is that neither the Utah group nor the Brigham Young group (whose account of its work appears on page 737, this issue) had, before seeking publication, carried out the rudimentary control experiment of running their electrolytic cells with ordinary rather than heavy water.

A close friend who is a Soviet biologist, on the telephone from the United States last week, was indignant at this neglect. He is correct. How is this astonishing oversight to be explained to students repeatedly being drilled in the need that control experiments should be as conspicuous in the design of an investigation as those believed to display the phenomenon under study? And how should the neglect be explained to the world at large?

There is no convincing explanation, only extenuating circumstances. Self-imposed secrecy has evidently hampered the investigators, understandably buoyed up by their belief that they had discovered a remarkable new phenomenon and fearful that too much talk about it would give other bigger battalions a chance to steal a march on them. Yet it is unthinkable that, if the authors had felt able from the outset to stand in front of routine laboratory colloquia and give a full account of their work, the question "Have you tried it with ordinary water?" would not have been raised. This glaring lapse from accepted practice is another casualty of people's need to be first with reports of discovery and with the patents that follow.

More subtle doubts perplexing those seeking to replicate the experiments would have been exorcised in the same process. The Brigham Young group, for example, clearly explains how it has been necessary to estimate the number of neutrons emitted from its electrolytic cells by subtracting from its observations of neutrons the background measurements, but Dr John M. Carpenter (one of the referees of the article by Jones *et al.*)

explains on page 711 that the background may fluctuate with time, which argues for the need for contemporaneous controls. Sadly, the neutron monitor is a special device, of which there is only one copy....

The Fleischmann and Pons experiments raise bigger questions, if only because the scale of the phenomenon they report is so much greater. Both groups report the detection of neutrons, but the Utah group (*J. Electroanal. Chem.* **261**, 301; 1989) requires that there should be  $10^{12}$  fusion reactions a second (within an order of magnitude in either direction) to account for the rate at which heat is produced, while the Brigham Young group is talking of one fusion reaction every 100 seconds or so. But the Utah group has not yet dealt with the natural question whether the observed energy output is energy stored in the palladium electrodes during the preparation of the cell. Records of cell voltage and current for the full duration of each run would go some way to settle the question, but have not been produced.

So are the extenuating circumstances sufficient to avoid the conviction of the scientific community for irresponsibility? No doubt the general opinion will depend on the outcome of attempts at replication, but the community might wish that its reputation did not hang on such a narrow thread, especially because the likelihood of replication fades as the days go by.

So robust scepticism is the only wise view. There may be something in the Brigham Young phenomenon, but that requires careful confirmation. The Utah phenomenon is literally unsupported by the evidence, could be an artefact and, given its improbability, is most likely to be one.

Luckily, there are a few blessings to count. Theoreticians have zealously recalculated the fusion rate between deuterons in a molecule (now reduced by 10 orders of magnitude) and have shown that the fusion rate between protons and deuterons, against naive expectation, is likely to be six orders of magnitude greater still — but still no more than  $10^{-14}$  per molecule of HD per second. A week or so ago, ingenious schemes for bringing bare hydrogen nuclei more closely together in the electron sea of a palladium lattice seemed to offer an escape from scepticism. But not for long, even if it is plain that metal hydrides are an even more interesting field of research than had been thought.

John Maddox

# The descent of the larynx?

John C. Marshall

AMONG the uninitiated the discovery of an old human hyoid bone reported by Arensburg *et al.* on page 758–760 of this issue<sup>1</sup> is likely to raise three questions: what is it; where is it; and why should anyone care? The answer to the first question is a small U-shaped bone, consisting of a body with two greater and two lesser horns. Between the root of the tongue and the larynx is the answer to the

It is at this point that the hyoid bone makes contact with a long-running controversy about the evolution of speech. Extant primates (monkeys and apes) do not spontaneously produce the range of phonetic vocalizations characteristic of human speech, and attempts to teach them to do so have met with very limited success<sup>2</sup>. Does their 'failure' reflect differences in the anatomical configuration of

their vocal tracts, or is it rather the case that they lack the requisite neuronal structures for the control of articulate speech? Computer-implemented modelling of the supralaryngeal vocal tract seems to indicate that some, but not all, vowels and consonants are "virtually impossible for the chimpanzee to articulate" (ref. 3).

These simulations by Lieberman, Crelin and Klatt<sup>3</sup> have not, however, met with unqualified acceptance. For example, the point vowels *i*, *u* and *a* cannot be simulated by their reconstruction of the chimpanzee vocal tract,

what degenerate specimen, deformed in life by arthritis, and after death by the very process of fossilization. Moreover, his hyoid bone is missing. As Lieberman<sup>5</sup> himself writes in a later discussion of the problems that arise when one tries to infer speech and language capacities from a fossil: "Nothing remains of the brain, the soft tissue of the vocal tract, or small bones like the hyoid and the cartilages of the larynx".

One of these statements has now been falsified. Arensburg *et al.*<sup>1</sup> have recovered a well-preserved human hyoid bone from Middle Palaeolithic layers of Kebara Cave, Mount Carmel, Israel. The specimen dates from approximately 60,000 years BC. Furthermore, the size and shape of this hyoid, and the positioning of the marks left by muscle attachment, are, for the most part, within the range of modern man. It is well known that the middle ear ossicles of Palaeolithic Neanderthals are likewise very similar to our own. Arensburg *et al.*<sup>1</sup> accordingly hypothesize that "the osseous elements derived from the embryonic branchial arches show less rapid evolutionary changes than bones derived from dermal or enchondral tissues". And they boldly speculate that the larynx itself may not have altered significantly since the Middle Palaeolithic.

Their evidence about the hyoid certainly makes it more likely that Neanderthal man was morphologically adapted to speech, although they do not elaborate in their paper on the hypothetical positioning of either the hyoid or the larynx. The inference that the Neanderthal larynx was positioned too high in the throat to produce *i*, *u* and *a* was a crucial feature of Lieberman's model<sup>3</sup>. It is generally accepted that the larynx descended in two stages and that in the first stage only neutral vowels could be formed. Consistent with this claim, Kratz<sup>6</sup> reports that

FIG. 1 The extrinsic laryngeal musculature showing the direction of movement of the hyoid bone, when the muscles contract from fixed origins. (From ref. 12.)

second. The third question is, of course, the interesting one.

In addition to supporting the base of the tongue, the hyoid bone is connected to the cartilaginous framework of the larynx by eleven muscles. Accordingly, any movement of the hyoid affects the positioning and movement of the larynx (Fig. 1). The extrinsic muscles of the larynx form two groups; the suprahyoid muscles, which act as laryngeal elevators; and the infrahyoid, which act as laryngeal depressors. These changes in turn affect the configuration of the supralaryngeal vocal tract and hence the nature of the noises produced when quasi-periodic bursts of air from the larynx are released through the oral and nasal cavities. Thus vigorous raising of the larynx decreases the volume of the supra-glottal cavity and thereby increases the supra-glottal pressure, to an extent permitting the production of such ejective sounds as *p'* or *t'*. Similarly, when the anterior belly of the digastricus muscle contracts from a fixed mandible (lower jaw), the hyoid, and hence the tongue, will move anteriorly and upward. The movement is required for such alveolar articulations as *s* or *i*. In short, then, the humble hyoid is vitally implicated in the mechanics of human speech production.

yet Jordan<sup>4</sup> reports that (real, live) chimpanzees do produce at least two of them! Lieberman and colleagues also claim, on the basis of a reconstruction of the La Chapelle-aux-Saints fossil, that Neanderthal man could not produce the point vowels. This skull, however, is a some-

FIG. 2 Conversation piece? An artist's impression of a Neanderthal family, by Maurice Wilson.

## HIGH-PRESSURE MINERALOGY

## Mechanisms of phase changes

D. C. Rubie

"linguistic reconstruction of the preproto-Indo-European language indicates an absence of differentiated vowels", although he dates this prehistoric language from a mere 10,000 years ago.

With respect, however, to the fossil record, it must be stressed that the distance from morphology to function is considerable. Who would have guessed solely from consideration of the anatomy of the syrinx — a structure very different from the larynx — that the mynah bird could produce such a passable imitation of human speech? Who, for that matter, would suspect that humans can learn to produce intelligible speech after surgical removal of the tongue, or of the larynx? Severe deformity of the vocal tract is compatible with human speech if a human brain is in command thereof. There are some lateral asymmetries of the modern brain that leave an impression on the skull, and these can be found on endocasts of Neanderthal man<sup>10</sup>. Such asymmetries at the posterior end of the sylvian fissure are thought to be related to linguistic capacity, although they can also be seen in apes that most emphatically do not possess language abilities.

The best witness to Neanderthals' intellectual level can perhaps be found in reconstructions of their culture (Fig. 2). There is good evidence of advanced stone tool manufacture, and presumptive evidence that Neanderthals "buried their dead with symbolic artifacts, including red ochre, animal bones, and flowers"<sup>11</sup>. The possibility that Neanderthals engaged in ritual murder<sup>11</sup> also links them to modern man, although whether one wants to regard this as an example of 'high culture' is, I suppose, debatable. All our inferences about the language, thought and culture of Neanderthals are based upon long, fragile and indirect lines of reasoning. The argument about their language capacity will undoubtedly run and run until we discover a deep-frozen Neanderthal who is susceptible to resuscitation. □

John C. Marshall is in the Neuropsychology Unit, part of the Neuroscience Group at the Radcliffe Infirmary, Oxford OX2 6HE, UK.

THE most abundant phase in the Earth's upper mantle is orthorhombic (Mg,Fe)<sub>2</sub>SiO<sub>4</sub> olivine. With increasing pressure, this phase transforms sequentially to the higher-density polymorphs  $\beta$ -phase (modified spinel structure) and  $\gamma$ -spinel. The transformation of olivine to  $\beta$ -phase coincides with and is generally believed to be responsible for the seismic discontinuity observed at a depth of 400 km. The mechanism of this phase transition, which is important in discussions of subduction dynamics, mechanisms of deep-focus earthquakes and the rheology of subducting lithosphere, has been a subject of debate for over 10 years. The new results of Burnley and Green reported on page 753 of this issue<sup>1</sup> now show without doubt that olivine can transform to the high-pressure spinel structure by two different reaction mechanisms, depending on the magnitude of differential stress as well as

mantle (see figure). The density of  $\beta$ -phase is about 8 per cent greater than that of olivine, and thus an elevated phase boundary such as that shown in the figure would produce a large negative buoyancy force which would contribute significantly to the driving forces of subduction and mantle convection<sup>2,3</sup>.

But if temperatures in the subducting slab are as low as suggested by thermal modelling (500–600 °C at a depth of 300 km), the kinetics of the transformation may become important in determining the position of the phase boundary. In this case, olivine persists metastably in a subducting slab, the elevation of the phase boundary and the negative buoyancy force are less than that predicted by an equilibrium model, and the rate of subduction may be controlled to a large extent by the kinetics of the transformation<sup>4,5</sup>. For this hypothesis to be

tested, experimental kinetic data must be extrapolated to subduction-zone conditions — a virtually impossible task unless the mechanism of transformation is understood so that an appropriate rate law can be used.

In experimental investigations of the transformation mechanism, compounds such as Mg<sub>2</sub>GeO<sub>4</sub>, Ni<sub>2</sub>SiO<sub>4</sub> and Co<sub>2</sub>SiO<sub>4</sub> have often been used because their high-pressure polymorphs are formed at pressures

Thermal structure of a subduction zone based on numerical modelling. The subducting slab (stippled) is bounded by dashed lines and 500 °C, 1,000 °C and 1,500 °C isotherms are shown (solid lines). The depression of the 500 °C isotherm to a depth of about 350 km in the slab causes the olivine- $\beta$ -phase equilibrium boundary (thick line) to be elevated in the slab ~ 100 km relative to the boundary in the adjacent mantle. (After Helffrich *et al.*<sup>10</sup>.)

the pressure-temperature conditions.

The nature of the transformation mechanism is particularly important in discussions of the driving forces of plate tectonics. Oceanic plates are created at mid-ocean ridges by the process of sea-floor spreading. The complimentary process of plate consumption occurs at ocean trenches where two plates collide and one of the plates descends deep into the mantle by a process known as subduction. The driving force for subduction comes from the density contrast between the cold slab and the hot surrounding mantle (see figure). In addition, a large driving force may result from density increases produced by high-pressure phase transitions such as olivine to  $\beta$ -phase or spinel. The pressure-temperature slope ( $dP/dT$ ) of the olivine- $\beta$ -phase equilibrium boundary is positive so that in subduction zones the position of the equilibrium boundary between the two phases is elevated by as much as 100 km relative to the adjacent

mantle which are readily attainable experimentally (1–6 gigapascal). Phases with these compositions are regarded as analogues of the mantle phases, although only spinel (and not  $\beta$ -phase) occurs as a high-pressure polymorph in Mg<sub>2</sub>GeO<sub>4</sub> and Ni<sub>2</sub>SiO<sub>4</sub>.

One mechanism for the transformation of olivine to spinel or  $\beta$ -phase involves incoherent nucleation (on olivine grain boundaries for example), with subsequent growth controlled by diffusion across the interphase boundary<sup>4</sup>. Another, which is analogous to a martensitic transformation and results from the propagation of partial dislocations, operates by shear of the oxygen sublattice and accompanying 'synchroshear' of the cations<sup>6</sup>. The new results of Burnley and Green<sup>1</sup> on the transformation of olivine to spinel in Mg<sub>2</sub>GeO<sub>4</sub> show that either of these mechanisms is possible depending on the experimental conditions. The incoherent nucleation and growth mechanism operates at low differential stress, high temperatures (above

700 °C) and conditions relatively close to equilibrium. In contrast, nucleation occurs by the shear mechanism under conditions of high differential stress, moderate temperature (600 °C) and pressure-temperature conditions which deviate significantly from equilibrium.

The different mechanisms observed in earlier experimental studies can now be readily explained on the basis of these new results<sup>1</sup>. Evidence for the incoherent nucleation and growth mechanism has come primarily from experiments carried out in large-volume high-pressure apparatus (for example, piston-cylinder and multi-anvil devices), whereas evidence for the shear mechanism has previously been found only in the products of diamond-anvil-cell experiments. The variability of these previous results can therefore be attributed primarily to the level of differential stress in the high-pressure apparatus.

The mechanism of the transformation of olivine to  $\beta$ -phase or spinel both in the mantle and in shocked meteorites can now be considered. At the 400-km discontinuity, where the temperature is high (1,400–1,500 °C) and differential stresses are low, the transformation probably occurs by the incoherent nucleation and growth mechanism. In shocked meteorites, however, olivine is most likely to transform to the high-pressure polymorphs by the shear mechanism under conditions of low temperature and very high differential stress. In subduction zones, where both temperature and differential stress have intermediate values, it is still uncertain which mechanism dominates. Apart from the questions of kinetics and the possible elevation of the phase boundary, there are potentially important implications associated with the two transformation mechanisms.

First the mechanism will influence the post-transformation microstructure and consequently may affect the rheology and mechanical properties of subducting lithosphere. At conditions which deviate significantly from equilibrium, transformation by the incoherent nucleation and growth mechanism results in very fine-grained spinel<sup>7</sup> (grain size 1–3  $\mu\text{m}$ ). In contrast, preliminary results suggest that when nucleation occurs by the shear mechanism, subsequent growth results in much coarser-grained spinel<sup>1</sup>. In the former case, the slab may deform by a grain-size-dependent superplastic mechanism and consequently the strength of the slab would be much lower than in the latter case<sup>8</sup>.

Second, there may be a close relationship between high-pressure phase transformations in subduction zones and the mechanisms of deep-focus earthquakes. Although this idea was first proposed more than 40 years ago, its validity and the nature of such a relationship are both

## Fossils from the Miocene of Abu Dhabi

THE Arabian peninsula was a unique land mass through which faunal elements from Europe, Asia and Africa could migrate and mix in the late Tertiary, about 25–2 million years ago. Its fauna at any particular epoch can be used to infer its geographical connections with other parts of the world. Therein lies the importance of a palaeontological expedition to the United Arab Emirates in January which unearthed an important fauna from the Late Miocene (about 8 million years ago). The fauna,

British Museum (Natural History)

Canine tooth (about 26 mm high) of a macaque-like monkey found in Abu Dhabi.

discovered by Peter Whybrow of the British Museum (Natural History) and his colleagues, consisted of deinotheres (proboscideans distantly related to modern elephants), hippopotami, small carnivores, horses, rhinoceroses, turtles, crocodilians, fish, birds and a macaque-like monkey (see figure). Ostrich eggshells twice as thick as any known today revive the myth of Sinbad's roc, a mythical bird large enough to carry off full-grown bull elephants. The fauna is clearly of Ethiopian origin, but artiodactyl (possibly cervid) limb bones may betray the presence of a few Holarctic elements from south-west Asia.

By 8 million years ago, the Tethys Ocean that had stretched across the Near and Middle East from the Mediterranean Sea to the Indian Ocean had long since closed: this

great seaway had been the overriding factor in animal migrations across the Old World since the late Palaeozoic, when it formed the boundary between the ancient land-masses of Laurasia (North America and Eurasia) and Gondwanaland (the southern continents and India). The Arabian Peninsula became an important land bridge: in the Miocene, the Red Sea was open to the Mediterranean, but was closed at its southern end by a land bridge between Ethiopia and the Yemen. Further east, the Tigris-Euphrates river system extended much further south than it does today. The new fauna represents a thriving community from what seems to have been the delta of this system. This idea is supported by the extent of the fauna, known from sites over an area of 16,000 square kilometres.

Apart from the intrinsic value of the fossils, Whybrow's team was able to refine knowledge of the stratigraphy of the Gulf Neogene. One example of this is their discovery of the horse-like *Hipparion* in the sediments, restricting rocks previously designated as 'undifferentiated Tertiary' to an age of less than 11.2 million years. *Hipparion* is not known from the Old World any earlier than this, and is an important zone fossil.

Well-watered palaeoenvironments from this region may seem surprising in the light of conventional wisdom about the Gulf area, long thought to have been arid for an extended period. The discovery of fossil fish in sandstone structures thought to represent dune fields forced the reevaluation of these formations as fluvial. In fact, desert conditions are unknown from the Miocene of this part of the world. The subsequent desiccation of the peninsula (during the Plio-Pleistocene) is related to increasing aridity worldwide: savannah opened up in Africa and the shrinkage of forests led to the development of ground-living hominids as well as modern plains animals such as grazing horses and ruminants. But the great drying was punctuated by short, wet episodes. In the Pleistocene, these may have been in synchrony with the glacial-interglacial cycle of the northern ice ages. Even 8,000 years ago, large parts of Arabia were green and pleasant, and areas now considered barren produced crops well into historical times.

Henry Gee

still uncertain<sup>9</sup>. The knowledge of the mechanisms of phase transformations in subduction zones should alleviate this uncertainty. □

## NUCLEAR PHYSICS

# The cold fusion family

James S. Cohen and John D. Davies

CLAIMS for the observation of cold fusion are based on two types of evidence. Jones *et al.*, on page 737 of this issue<sup>1</sup>, report that they have detected neutrons, with energy characteristic of a fusion reaction, in an electrochemical cell containing deuterium. And Pons and Fleischmann report in the 10 April issue of the *Journal of Electro-analytical Chemistry*<sup>2</sup> the production of unexplained excess heat and also neutrons in a similar cell. It is wise to see whether the observations can be explained using standard physics before seeking novel solutions — especially as the two reports conflict greatly in detail.

Cold fusion is a known process, but not as described in the new work. A muon — a heavy analogue of the electron — substituted for an electron in a deuterium molecule can cause the molecule to contract so that there is a significant probability of the two nuclei coming into contact. A fusion reaction can follow in which energy is carried away by the products. The muon is released and can induce further fusions. This is muon-catalysed fusion<sup>3</sup>.

Considerations of this process in the context of the present experiments is natural, because Van Sicken and Jones have previously suggested<sup>4</sup> that very high pressures could similarly induce fusion; because some have suggested that muons from cosmic rays could be responsible for the observed effects; and because lessons about the relative rates of different fusion reactions could be important. The reactions of interest are those of deuterons ( $d = {}^2\text{H}$ ), tritons ( $t = {}^3\text{H}$ ) and protons ( $p = {}^1\text{H}$ ).

correspondingly. The mean time for a fusion reaction then becomes (ref. 5)  $8 \times 10^{-13}$  s for d-t,  $2 \times 10^{-9}$  s for d-d. (The lesser speed of the d-d reaction arises in part because fusion occurs in a state with one unit of angular momentum which creates a centrifugal barrier to fusion. The d-t molecule is also initially formed in such a state but, because of its asymmetry, rapidly makes a transition to a zero-angular-momentum state.)

It is useful to consider the description of fusion in nuclear-scattering experiments. Besides the probability of barrier penetration, the subsequent interaction between the nuclei (expressed in the 'astrophysical'  $S$  function) has an important influence on the fusion rate or cross-section  $\sigma$ :

$$\sigma = \frac{S}{E} \exp(-31.3 \sqrt{\mu/E})$$

where  $\mu$  is the 'reduced' mass in atomic mass units of the colliding nuclei and  $E$  is the centre-of-mass collision energy in keV. The variation of  $S$  for the various reacting nuclei can be crucial. In the low-energy limit, which clearly applies to cold fusion,  $S = S_0$  and is smallest for the p-d reaction ( $2.5 \times 10^{-4}$  keV barns)<sup>6</sup>; this is because the final stage involves the emission of a  $\gamma$ -ray, an electromagnetic process which is inherently weaker than the strong-force interactions of the other fusion reactions. For d-d,  $S_0$  is  $1.08 \times 10^2$  (including both channels<sup>7</sup>); for d-t, which involves a strong resonant intermediate state of  ${}^3\text{He}$ ,  $S_0$  is  $1.15 \times 10^4$  (ref. 8).

Nevertheless, at low energy the

Here  $n$  signifies neutrons;  $\gamma$ ,  $\gamma$ -rays;  $\mu$ , negative muons; the energy carried by fragments is given in megaelectron volts; and the percentages signify branching fractions in muon-catalysed reactions.

Before fusion, the nuclei are held apart by Coulomb repulsion. This barrier is penetrated by quantum-mechanical tunnelling, rather than being surmounted. Note that tunnelling is controlled more by the width of the barrier than by its height. Thus, replacing the electron in a hydrogen ion by a muon reduces the separation of the nuclei by a factor almost equal to the muon/electron mass ratio (207), reducing the 'tail' of the Coulomb barrier

'Gamow' penetrability factor becomes dominant, and significant variations arise between the various fusion rates because of the variation in reduced mass. Thus for bare nuclei, the d-t fusion rate exceeds that of d-d for collision energies above about 400 eV, and the p-d rate exceeds that of d-d below about 200 eV. The implications of the two factors for the case of cold fusion, in which the Coulomb repulsion is shielded by electron or muon screening, is also instructive. Only the barrier penetrability factor is changed by the screening (see figure); also we have just established some useful energies at which the relative fusion rates change.

Schematic of the potentials between two nuclei (not to scale): solid line, unscreened; broken, with electron screening (chemical bonding); dotted, with muon screening. To the right of the barrier, electrostatic interactions are dominant; to the far left, strong nuclear interactions occur as expressed by the astrophysical  $S$  factor. Wavy line indicates collision energy  $E$  in scattering experiments, the classical distance of closest approach ( $R_0$ ) at the arrow head. The bond length ( $x$ ) is actually about 207 times shorter for muons than for electrons and the potential well is about 207 times deeper.

From these it is possible to show that muon screening favours d-t fusion; normal electron screening favours p-d fusion (although in this case fusion rates are unmeasurably slow).

The characteristic separation in the isotopic hydrogen molecules is the bond length — normally somewhat greater than the distance  $R_0$  at which repulsion between the nuclei becomes apparent. Allowing the nuclei easily to approach this close is roughly equivalent to colliding the bare nuclei together with a centre-of-mass energy  $14/R_0$  eV where  $R_0$  is measured in ångströms. (Such simple considerations have to do for now since an accurate calculation of the penetrability requires knowledge of the potential energy interaction of d-d in the crystal, which is unknown for electrochemical cold fusion.) For the ordinary hydrogen molecule,  $R_0 = 0.7$  Å, so that the equivalent energy is about 20 eV, well below the value 400 eV at which d-t fusion becomes faster than d-d. But with the ion's electron substituted by a muon,  $R_0 = 4 \times 10^{-3}$  Å, so that the equivalent energy is about 3,500 eV and d-t fusion is clearly favoured (by a factor of 36 in the zero-angular-momentum state according to calculations of C.-Y. Hu (personal communication)). Although muon-catalysed fusion presents the most dramatic evidence of the effect of screening on fusion rates, similar electron-screening effects have been seen in reactions such as (ref. 9)  ${}^3\text{He} + d \rightarrow {}^4\text{He} + p$ .

Screening effects should be considered in discussing the new results. Any means of reducing  $R_0$ , vibrational excitation of the bond, a reduction in the bond length, or even a flattening of the potential-

energy well could be effective. It is interesting to note that for the shielding distance relevant to the new studies (of the order of  $10^{-1}$  Å) the p-d fusion rate should exceed that for d-d. This reaction should be studied experimentally; there seems to be no advantage in using d-t, however.

Some have suggested that the new results could be an artefact due to fusion catalysed by cosmic-ray muons. This seems most improbable: the muon stopping flux is not high; the fraction captured by deuterium is low; and the fraction retained by deuterium is even lower. Also, because the muonic molecule formation rate is too slow and because a significant fraction of the muons stick to the helium at fusion, each one can catalyse only a few reactions.

It is reasonable to take  $0.1 \text{ g}^{-1} \text{ h}^{-1}$  to be the upper limit to the rate for muons being stopped in a Utah basement (J. Osborne, personal communication). Heavy elements are better at stopping muons, the capture ratio being roughly proportional to nuclear charge  $Z$  (ref. 10). Moreover, any  $d\mu$  would initially have about an electron volt of kinetic energy<sup>11</sup>: while slowing down, many muons would be transferred to the high- $Z$  atoms<sup>10</sup> (high- $Z$  contaminants are kept to less than  $10^{-4}$  of contents in muon-catalysed fusion experiments). Lastly, the time for formation of the muonic deuterium molecule is comparable to the muon lifetime ( $2.16 \mu\text{s}$ ) so that few fusions can be catalysed by each muon.

For the sake of argument, however, assume that the above limitations can be removed: that is suppose that channelling in the crystalline electrodes keeps muons from the high- $Z$  atoms and the deuterium density is so high that d-d collision rates do not limit the process. The lifetime of a muon would then be sufficient to catalyse 1,000 fusions. But this also assumes it is continuously available for catalysis. In fact, in 8 per cent of d-d fusions the muon sticks to the  $^3\text{He}$  to form muonic helium<sup>12</sup>. Although in subsequent collisions of the muonic helium with deuterium, the muon could be stripped this will happen for only 32 per cent of captured muons, even with very high deuterium density<sup>13</sup>. (The high- $Z$  elements have large stripping cross sections, but stripping in this case often results in capture of the muon and so is not helpful<sup>14</sup>.) Hence, even under the most favourable circumstances, a single muon would catalyse only about 20 d-d fusions (or 340 d-t fusions). With the above muon stopping rate and assuming an electrode mass of 3 g, the neutron production rate would be  $2 \times 10^{-3} \text{ s}^{-1}$ , well short of the  $0.41 \text{ s}^{-1}$  reported by Jones *et al.*<sup>1</sup>.

Of course, if the fusion is catalysed by some stable charged quasiparticle in the electrode, one no longer has to contend with the short lifetime encountered with the muon. This can even offset the slower fusion rate that is inevitable with quasi-

### Fusion in 1926: plus ça change

ON September 17, the *Morning Post* published a Reuter message from Berlin to the effect that Profs. Paneth and Peters of that city had, after years of experimenting, succeeded in transforming hydrogen into helium "with the aid of particles of metal." This announcement, if correct, is of great importance and will evoke even more interest than the claim by Miethe and Stammreich to have transmuted mercury into gold.

No particulars are yet to hand concerning the methods adopted by Profs. Paneth and Peters, for the statement "with the aid of particles of metal" is meaningless as it stands. The experimental difficulties must be very great, not only in obtaining the energy necessary for such a change, but also in applying it under the appropriate conditions. Moreover, helium is an atmospheric gas, and traces of it are difficult to eliminate by the methods of evacuation and adsorption at present in use; belief or disbelief in the Reuter message must be reserved pending further and more definite evidence.

\* \* \*

PROFS. F. Paneth and K. Peters describe in outline how they have succeeded in detecting the presence of very minute amounts of helium, of the order of one hundred millionth of a cubic centimetre, derived from hydrogen which had been absorbed by finely divided palladium at the ordinary temperature.

Finely-divided palladium, either as sponge, 'block' or palladinised asbestos, was used to absorb hydrogen at room temperature. The residual gas obtained after a 12-hours' contact between palladium and hydrogen exhibited four or five lines of the helium spectrum; there was also a distinct proportionality between the amount of helium observed and

the duration of the time of contact. The activity of the different palladium preparations employed varied considerably; it invariably diminished with repeated use. No helium production was observed with palladium preparations that did not absorb hydrogen. They were not able to detect any trace of the energy liberated during the transformation, and they point out that the amount set free from the conversion of such small quantities of hydrogen — about 0.28 calorie — would be extremely difficult to detect, particularly if thermal changes due to absorption or formation of compounds also take place. They incline to the view that the liberated energy is more likely to appear as radiation,  $\gamma$  or Millikan-rays, than as heat.

\* \* \*

A FEW months ago, K. Peters and I published an account of experiments we had made in an attempt to transmute hydrogen into helium (*Ber. d. Deutsches Chem. Ges.*, 59, 2039, 1926). As a result of further experiments, we are in a position to give an explanation of the occurrence of the observed very small quantities of helium in our experiments without having recourse to the assumption of a synthesis of helium.

In the communication we discussed the possibility of regarding the helium dissolved in the glass as an explanation of the observed effects, but blank experiments led us to the conclusion that the quantity of helium liberated in this way was beyond the sensitivity of our method of detection. In the interval we have carried out experiments that show that the liberation of helium from glass is dependent on the presence of hydrogen. Thus glass tubes which gave off no detectable helium when heated in a vacuum or in oxygen yield helium in quantities of the order of  $10^{-6}$  c.c. when heated in an atmosphere of hydrogen.

As a result we have thus established that, in using an apparatus made of glass, one cannot make any trustworthy statement as to the origin of  $10^{-9}$  c.c. of helium if air comes in contact with the apparatus.

From *Nature* 118, 455 & 556 (1926); 119, 706 (1927).

particle masses less than that of the muon. Van Siclen and Jones's earlier calculations<sup>4</sup> suggest that reducing the hydrogen bond length by a factor of 2 (we believe a larger factor is needed), achievable with a quasiparticle with twice the electron mass, might give the neutron production rate reported now by Jones *et al.*<sup>1</sup>. Large effective electronic masses are often associated with transition metal crystals like palladium; unfortunately, the notion of heavy electrons is related to the non-local interactions of electrons with the crystal lattice; it is not easy to see how the local concept of tight binding can be squared with this.

The neutron rates observed by Fleischman and Pons<sup>2</sup> present further difficulties. Not only are they much higher, at about  $10^3 \text{ s}^{-1}$ , than those of Jones *et al.*, but they are a factor of about  $10^3$  less than expected from the rate of d-d fusions necessary to generate the heat they report. Thus they suggest some form of aneutronic fusion is occurring: for example a preference for

reaction 1a over 1b.

The equality of rates for 1a and 1b given by charge symmetry of nuclear forces is slightly altered by Coulomb 'isospin' mixing (G. M. Hale, personal communication). For bare nuclei (plasma fusion) the p + t product channel is very slightly favoured, but for muon-catalysed fusion the  $n + ^3\text{He}$  channel is favoured by a ratio of 1.4 (ref. 15). The latter is a consequence of fusion taking place in a state of unit angular momentum. In any event, it would seem quite difficult to suppress the neutron channel or to hide the tritium from assay. The normally rare radiative channel,  $d + d \rightarrow ^4\text{He} + \gamma$  (20 MeV), would also show up in the lower-energy  $\gamma$ -ray detector from pair production. On the other hand, only heat would be detected if it were somehow possible for the energy to go directly into the palladium crystal lattice ('Mössbauer fusion'), but such a process is expected to be strongly suppressed by the vastly different energy scales of the crystal lattice (eV) and fusion

## ECOLOGY

(MeV). Likewise, as indicated by the small branching fraction for reaction (3b), transfer of all the energy to a heavy electronic quasiparticle, even if it exists, is highly unlikely unless it is even more massive than the muon. Curiously, an excess amount of  $^4\text{He}$  did show up in the assay done by Fleischmann and Pons.

The above difficulties in interpreting the Fleischmann and Pons experiment in terms of d-d fusion lead one to consider the possibility of other nuclear reactions that might not produce neutrons or tritons. The electrolyte contained lithium so that  $^6\text{Li} + \text{d} \rightarrow ^4\text{He} + ^4\text{He}$  fusion is possible at the electrode surface or with long lithium drift times into the palladium; the intermediate state,  $^6\text{Be}$  has a rich set of resonant energy levels to enhance the reaction, but it is difficult to see how the autronic reactions  $^6\text{Li} + \text{d} \rightarrow ^7\text{Be} + \text{n}$  and  $^6\text{Li} + \text{d} \rightarrow \text{n} + ^4\text{He} + ^4\text{He}$  could be suppressed. Another difficulty is the smaller penetrability that comes from the greater nuclear charge, the higher reduced mass and the larger bond distance. For similar reasons, a cold fusion of d with Pd can be considered highly unlikely. Here again we note that there is the possibility of reaction with p as well as d, namely  $^7\text{Li} + \text{p} \rightarrow \alpha + \alpha$ .

In all this discussion, we have presumed that the current observations<sup>1,2</sup> truly belong to the cold fusion family. We might point out that they could be but a distant cousin. For example, experiments show that d-d fusion neutron emission can accompany the fracture of a LiD crystal<sup>10</sup>; the interpretation is that deuterons are accelerated to kiloelectron volt energies by the strong electric fields at the propagating crack. Such an effect might occur in the embrittled Pd or Ti crystal, in which case we would have 'microscopically hot' fusion under very unusual conditions. Neutrons would be emitted in bursts, not continuously. Other means of creating cracks suddenly would lead to similar effects. □

## Honeyguides and humans

Robert M. May

ONE of my favourite children's books is an engagingly illustrated account of some of the mutualistic associations found in nature. One such illustration is of the honeyguide — appropriately named *Indicator indicator* — perched on a branch over a bee colony being torn apart by a badger-like ratel. The ratel has been led to the hive by the bird, and after the ratel has finished feasting on the honey, the honeyguide will feed on fragments of honeycomb left behind. The honeyguide needs the ratel because the bee colonies are typically situated in large trees, rock crevices or termite mounds in such a way as to be inaccessible to the unaided bird; the ratel apparently benefits from the honeyguide's deliberately leading it to the source of honey. Isack and Reyer<sup>1</sup> have

Ardea/Peter Steyn

Young honeyguide leaving the nest.

just completed a 3-year study in which they document the involvement of a third species in this association — humans.

Rock paintings in the Sahara, Zimbabwe and South Africa show that humans have collected honey in Africa for at least 20,000 years<sup>2</sup>. Many anecdotes (the earliest dating back to the seventeenth century<sup>3</sup>) suggest that humans have cut into the honeyguide–ratel dance, using the bird to help guide them to honey sources. Sceptics have viewed these anecdotes as romantic myths, and the issue may soon become moot because in many areas honey is increasingly obtained from bee-keeping or is being replaced by commercial sugar or other products; in these areas, the birds no longer guide.

Isack and Reyer's study<sup>1</sup> of the interactions between honeyguides and nomadic

Boran people in northern Kenya is therefore timely and interesting. Treating this system as if it were any other field study of a mutualistic association, the authors show that, in unfamiliar areas, honey-hunting human groups take on average 3.2 hours to find each bees' nest when guided by a bird, and 8.9 hours when not guided. This roughly threefold reduction in searching efficiency without a honeyguide is a conservative estimate, because the figures do not include the many days of unguided search on which no nest was found.

Isack and Reyer also document the benefit to the birds: 96 per cent of the nests they saw discovered (178 of 186) would not have been accessible to the birds until humans had opened them with tools. In addition, the Boran's use of smoky fire reduces the bird's risk of being stung. Because of the pronounced benefits to both parties, it is not surprising that humans and honeyguides have elaborated upon the previous ratel–honeyguide association by developing their own inter-specific communication system. Humans attract the bird with a penetrating whistle that can be heard more than 1 km away; Isack and Reyer found such whistles doubled the rate at which birds were encountered. On its part, the honeyguide attracts human attention by flying close or hopping around among perches, emitting a characteristic double-noted call.

Once humans and birds are engaged in a cooperative quest, Isack and Reyer show that the bird leads in consistently direct routes to colonies up to 1 km or more distant. Isack and Reyer find quantitative support for Boran honey-collector lore, demonstrating that three measures of bird behaviour decrease with diminishing distance to the bee colony: (1) the length of time the bird disappears after the first encounter; (2) the distance between the perches where the bird waits until the follower has caught up; and (3) the height of such perches. On arrival at the nest, the bird perches close to it and gives a characteristic 'indication' call (this call, like the initial one, is documented in sonograms). The bird also hops among close perches, often circling the nest in between perching. Isack and Reyer remark that this behaviour of effectively reducing the 'step length' as the goal of the search is approached is another example of a pattern (often called area-restricted search) that is ubiquitous in nature, being found, for instance, in flies looking for sugar particles<sup>3</sup>, parasitoids searching for hosts to oviposit on or in<sup>3</sup>, or schistosome miracidia homing in on snails as intermediate hosts<sup>4</sup>.

How do the honeyguides find the nest to which they guide their ratel or human associates? One answer is that the birds know the location of colonies in advance, another is that the birds literally 'wing it' until the sight or sound of accidentally encountered bees gives a clue. The rather straight flight-paths recorded by Isack and Reyer argue indirectly for the former explanation. More directly, Isack and Reyer watched from blinds and saw several unaccompanied honeyguides visiting nests, apparently on tours of discovery and inspection (when the bees were relatively quiet, as on cool mornings, birds would actually fly into the entrance of a nest and peer into it).

Isack and Reyer's study is, of course, engaging in itself. But, as the authors observe, it also addresses a larger issue. Boran 'ecologists' knew all their conclusions, even though they had not buttoned them down with sonograms and Mann-Whitney two-tailed tests. To an even greater degree, in the tropical rainforests

of Africa, Asia and South America, about whose flora and fauna conventional science knows so little, a vast store of ecological knowledge resides among the diminishing groups of native people, who draw upon such knowledge for food-gathering, medicine and other aspects of daily life. Ethnoecology, ethnobotany and other such disciplines are in their infancy. They hold the promise of helping us answer important questions more quickly than will otherwise be possible. Yet these possibilities are disappearing, as the cultures of native people are being destroyed at an even faster rate than the forests and other places where they live. □

## OENOLOGY

# In vino veritas

Robert W. Cahn

GRAPE juice is often 'enriched' with additional sugar, in the hope of enhancing the quality of the wine resulting after fermentation. The European Community (EC), in the shape of the Council of Ministers, occasionally debates whether or not to prohibit the practice, or to limit the amount and type of sugar that may be added, and new regulations will eventually be promulgated. However, such regulations would be pointless without a reliable method to detect the added sugar, after fermentation is complete. Such a method now exists<sup>1</sup>, and the EC recently approved it as a standard Community procedure.

Jean Antoine de Chaptal (1756–1832)

was an agile French chemist who managed to keep his head while an eminent contemporary, Lavoisier, lost his to the post-revolutionary Terror. A landowner, Chaptal introduced the cultivation of sugar beet, the British blockade having prevented the normal importation of cane sugar. Having succeeded in this, he proposed that after summers with too little sun, grape juice be fortified with beet sugar so that it fermented as it should. Ever since, the process of fortifying wine in this way has been known among the French as *chaptalisation*. The *Supplement* to the *Oxford English Dictionary* defines chaptalization more broadly: "to convert or improve the must, in wine-making, by neutralizing an excess of acid or adding sugar". In the EC's Council of Agriculture Ministers, the French and the Germans, dwellers in cool climes, are inclined to refer to it informally as enrichment; the British, more neutral in the matter, call it sugaring; and the Italians and Greeks, whose hot climates ensure that grapes are never short of sugar, complain of adulteration.

Whichever word is preferred, the

Commission has concluded that recent developments due to Gérard Martin's team at the University of Nantes will allow chaptalization to be identified *ex post facto*. Indeed, the French authorities, ever concerned to protect the reputation of French wines, some years ago offered a prize of 1 million francs for an effective method of detection, and Martin was the winner. Martin's most complete account of his technique was published last year<sup>1</sup>.

Characterization of wines and distilled liquors has for a long time used one of two approaches: either sensory analysis, which is an impressive name for tasting and sniffing (see illustration), with a top-dressing of multivariate statistical analysis and psychology, or capillary gas chromatography, which identifies the numerous esters and other constituents which are responsible for flavour. These approaches are critically discussed in a recent book<sup>2</sup> and clearly have serious weaknesses — not least, the difficulty arising from the fact that the population of esters, and so on, is constantly changing as a wine matures. In the same book, Williams<sup>3</sup> in particular examines the problems involved in tracking down a wine to its region of origin and in testing for chaptalization, and points to the special strength of the method introduced by Martin 'site-specific natural isotope fractionation' (SNIF).

The analysis of isotope ratios has, of course, become steadily more prevalent in geochemistry, environmental sciences and biochemistry; as practised in these disciplines, the normal tool is the mass spectrometer and isotope ratios refer to molecules or crystals as a whole. Attempts have been made to use the <sup>13</sup>C/<sup>12</sup>C ratio to distinguish between sugars from different sources (grapes, cane, beet), as different plants follow different photosynthetic cycles. It is possible to distinguish with some confidence between wines fortified with cane sugar and unfortified ones<sup>4</sup>, but it seems that beet sugar poses an insoluble problem with this technique (though the adulteration with beet sugar of rum, made from cane sugar, is detectable).

The drawback of the traditional method of isotope analysis is that only the overall isotope ratio in a molecule can be measured. Martin's method overcomes this limitation by measuring the proportion between hydrogen and deuterium in a specific site within an organic molecule by nuclear magnetic resonance. This type of measurement can be used to 'fingerprint', in particular, alcohols fermented from different sugar precursors. Ethyl alcohol has two distinct carbon-bonded hydrogen sites, the methyl and methylene sites, and by measuring D/H ratios for these sites separately, as well as for the water constituent of wines, Martin and co-workers can pinpoint the botanical and (to a somewhat lesser degree of reliability) the geographical origin of the alcohol. ▶

sentir le bouchon: olfactory sensory analysis will soon be displaced by SNIF-NMR<sup>1</sup>. (From *l'enseigneur le Vin*, Etablissements Nicolas, Paris, 1927.)

Martin and his wife, Maryvonne, first proposed<sup>4</sup> the SNIF-NMR method in 1981 and gave a much more detailed account<sup>5</sup> in 1986. In the meantime their son, Gilles, set up a company, Eurofins, in Nantes to exploit the patented technique, and the general assembly of the *Office International de la Vigne et du Vin*, a long-established intergovernmental body with 33 member states, in January 1987 after 4 years of tests approved SNIF-NMR as an officially recognized method of "displaying the chaptalization of wine" and the EC followed suit the following year.

In the SNIF-NMR method, the wine is distilled to obtain almost pure alcohol; this is necessary to enhance the precision of the NMR measurement, which depends on the alcohol concentration in the NMR sample. Recent research has established that, in general, results are more consistent if measurements are made only on the alcohol resulting from fermentation, not on the original must or grape-sugar solution. In fact, a recent (April 1988) resolution of the *Office International* has specified that only alcohol analyses be used for its purposes. The D/H ratios, which can generally be determined to a precision of 0.2 parts per million from the relative intensities of NMR lines, each identified with a distinct deuterated 'isotopomer', are calibrated against internationally standardized water samples<sup>6</sup>, against standard tetramethylurea and against a collection of sealed standardized alcohols fermented from different precursors, provided by the Community Bureau of References. Of course, the total weighted D/H ratio for an alcohol molecule taking into account all sites should match the D/H ratio obtained by mass spectrometry. According to Martin *et al.*<sup>1</sup>, there is indeed quite good agreement but with a systematic deviation of a few parts per million, which has recently been traced to differences in the deuterium ratio of the mutually exchanging hydroxyl sites of

water and ethanol (G. J. Martin, personal communication).

Over several years, Martin's team analysed many certified wines from France and other countries represented by the *Office International*, seeking correlations of the D/H ratios (for the methyl and methylene sites in alcohol and for water) with factors such as grape variety, region of origin (and hence climate) and of course chaptalization. The statistical method used is canonical variate analysis, aided by a specialized computer diagnosis system, ISOLOG<sup>7</sup>. Different weighted combinations of experimental variables (here, D/H ratios) are systematically compared to find the one best correlated with a particular external factor. The figure shows the results of the test of the distinguishability of groups of wines from the south of France, Switzerland and Tunisia, and the statistical separation is clear enough. The method can often distinguish between wines made from different grape varieties. The D/H ratios seem to vary according to the sugar concentration in the various grapes, which itself is a function of geography, grape variety

#### ELECTRON TRANSFER

## Energizing protons in membranes

R. J. P. Williams

In 1961, two proposals were made as to the way in which electron-transfer reactions of the cytochrome chain — the chain used in the oxidation of NADH by molecular dioxygen — could be connected to ATP formation without the intervention of chemical intermediates<sup>1,2</sup>. Both mechanisms invoked the transduction of the energy of the oxidation/reduction reaction to a proton gradient before the gradient generates ATP. The two mechanisms, sometimes termed the delocalized (Mitchell) hypothesis and the localized (Williams) hypothesis, are very different. In the first, protons generated by oxidation appear only in aqueous phases. Even ATP is generated by an electric field acting on the ATP synthetase and not by proton flow. In the second, protons move in proteins within matrices and aqueous phase equilibrations are ignored in the development of proton gradients, in proton diffusion and in the ATP-synthesis step. To distinguish between these mechanistic possibilities, long series of experiments have been carried out on separate parts of the cytochrome chain. The most decisive attack on the last stages of the electron-transfer reactions, those of cytochrome oxidase, has been carried out by Wikström and his collaborators<sup>3</sup>. Wikström reports his latest data on page 775 of this issue<sup>4</sup>.

Wikström and colleagues first showed that apart from the protons which react

and the weather preceding a vintage.

As things stand, Community regulations permit enrichment of grape must only with other (more concentrated) grape must, natural or rectified, except in those countries having a long tradition of adding beet sugar, which are free to follow their national rules. The Council of Ministers some time ago instructed the Commission to report to it on current enrichment practices; this report is due soon, and then the Council will have to try to reach agreement on future regulations for Europe as a whole. It undoubtedly is an extremely sensitive political issue. □

FIG. 1 Cytochrome oxidase (refs 5,6). The reaction centre binds dioxygen which is converted to water by the removal of protons from one side of the membrane (bottom). All the dioxygen reactions take place at the  $a_3$ - $\text{Cu}_B$  site while electrons come into the site from cytochrome *c* via haem *a* and  $\text{Cu}_A$ . The protein has several (putative) transmembrane helices and some, not all shown, are involved in proton pumping. One  $\text{H}^+$  for each electron is used stoichiometrically.

## Blow the fuse!

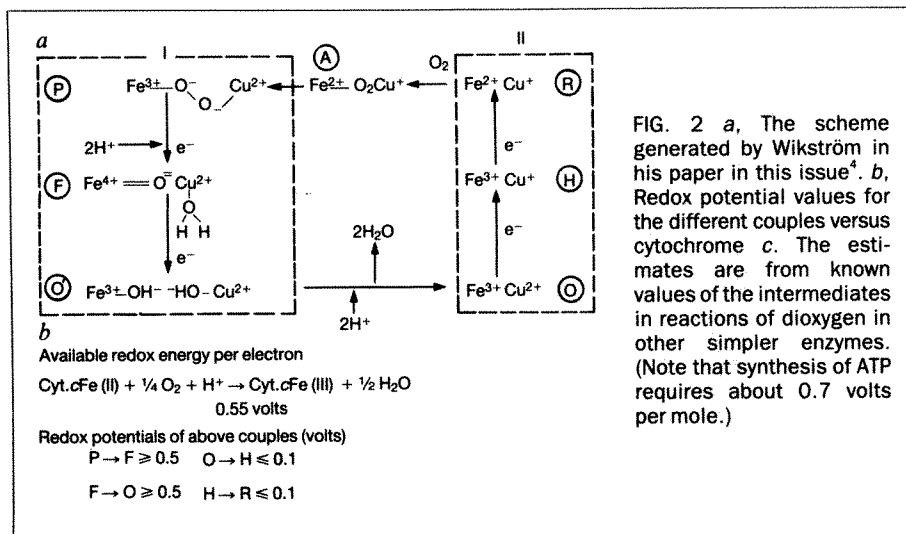

FIG. 2 *a*, The scheme generated by Wikström in his paper in this issue<sup>4</sup>. *b*, Redox potential values for the different couples versus cytochrome *c*. The estimates are from known values of the intermediates in reactions of dioxygen in other simpler enzymes. (Note that synthesis of ATP requires about 0.7 volts per mole.)

directly with dioxygen and which must diffuse through the protein matrix to the reaction centre in the membrane, additional (one H<sup>+</sup> per electron) protons are in fact energized by the reactions of molecular dioxygen in the membrane, and that these protons are pumped (in proton channels) across the membrane by gated energized diffusion<sup>3</sup>. The nature of the gating is as yet unknown. In an effort to elucidate the reaction path, Wikström now considers more precisely the coupling steps between the reduction of dioxygen by electrons and this proton pumping<sup>4</sup>. He concludes that proton pumping, which, note again, is separate from the protonation steps of dioxygen itself, occurs in association with the reaction steps involving only the first and second electrons of the four required to convert O<sub>2</sub> to 2H<sub>2</sub>O. I shall now consider some consequential mechanistic features.

In a protein such as cytochrome oxidase, consisting in all probability of membrane helices<sup>5,6</sup>, cooperativity should occur via conformational changes on O<sub>2</sub> uptake or electron transfer as in haemoglobin and haemocyanin. In fact the a<sub>3</sub>Cu<sub>B</sub> centre of the cytochrome oxidase can be thought of as half haemoglobin and half haemocyanin (Fig. 1). Now the reactions of these proteins and of oxidases such as cytochrome P<sub>450</sub> and even of cytochrome *c* with ligands are known to occur from one side of the proteins only via groove-opening reactions. It is hardly surprising, then, that the reactions of cytochrome oxidase, O<sub>2</sub> + 4e<sup>-</sup> + 4H<sup>+</sup> → 2H<sub>2</sub>O, occur through the oxidase from only one side of the membrane in which the protein is lodged. The apparent surprise is that the additional proton pumping in a different, helical channel is driven by the first two steps of reduction only.

Let us consider the steps. Each of the steps R → P, P → F, F → O, O → H and H → R are expected to be linked to conformational changes (Fig. 2 and see Fig. 1). The step R → P is not reversible. Whatever the series of conformational switches, the

later steps return the protein to its initial state in a cyclic, irreversible manner and so cannot be the forward strokes of a proton pump. Again, the redox energy of dioxygen relative to cytochrome *c* is largely lost going from P → O because the last two one-electron potentials of the oxidase are not far from those of cytochrome *c* itself (Fig. 2). It is good sense that the cyclic functioning of a pump has highly energy-using initial steps and later relaxation steps driven by little energy loss.

How does this pump compare with other ion pumps, such as ATP-synthetase, Na<sup>+</sup>/K<sup>+</sup> ATPases and Ca<sup>2+</sup> ATPases, and bacteriorhodopsin? In all these cases it has been supposed that cyclic helix/helix motions of proteins are part of the mechanical device in the pump. Moreover, it seems that the sites of energy input (here of ATP to the ion movements) are far in space from the gated channels, which are frequently considered to be constructed from anionic sites on helices within the membrane. The parallels with cytochrome oxidase are fairly close. Moreover in several cases where intermediates, such as phosphorylation of proteins, have been seen, the last steps, now loss of inorganic phosphate, act not in the pumping stroke but in relaxation, and release little energy.

It seems that several pumped movements of ions and possibly molecules in proteins in membranes have common features — helical protein structures, cycling conformation changes and readily distinguishable forward pumping and return steps where energy commitment is largely in the first steps. □

LABORATORIES all round the world are trying to replicate the claimed electrolytic cold nuclear fusion from heavy water. Some may regard this as premature when the one crucial control experiment, the equivalent electrolysis of light water, has not yet been tried. But with his usual optimism, Daedalus has set DREADCO's electrochemists to forcing deuterium into palladium electrodes, and is determined to interpret any excess heat production as nuclear fusion, rather than some banal chemical or lattice effect.

Palladium has to take up a lot of deuterium before any heat is disengaged at all, but thereafter things seem to accelerate rapidly. This makes obvious sense: each site in the palladium lattice will take up a deuterium atom until all the sites are full. Further deuterium atoms will then enter already-occupied sites, and these close-packed pairs stand a chance of fusing together by quantum tunnelling. The energy released can, apparently, even melt the palladium.

But Daedalus goes further. He points out that as two nuclei approach each other, the chance of successful quantum tunnelling rises dramatically. So a sphere of deuterium-saturated palladium would make an ideal implosion-style hydrogen bomb. At atmospheric pressure it would release a steady heat flux and an inconvenient but containable neutron flux. Surround it by shaped charges of high explosive and crush it suddenly to half its volume, and the result should be a splendid combined fusion explosion and neutron emission. Despite the deadly momentary neutron flux, this elegant bomb would release almost no enduring fallout: a valuable military advantage. Lacking a critical mass, it could also be made in usefully small sizes.

Daedalus is rather diffident about contributing to weapons research. In self-defence he claims that nuclear physics is supported so lavishly by national governments only because it once produced a bomb. To keep the funds coming in, the subject really has to repeat the trick from time to time. In any case a pure, hygienic, noble-metal fusion weapon is a great ecological improvement on nasty poisonous and radioactive fission weapons, and should be supported enthusiastically by the increasingly militant 'green' political parties. But in more peaceful vein, Daedalus is also devising a fusion-powered watch. Each time its oscillating palladium hair-spring flexes, deuterium fusion accelerates on its compressed face, and slows down on its tensioned face. The differential thermal expansion unwinds the spring; the inertia of the balance wheel drives it the other way, generating the opposite thermal gradient, and so on. A tiny charge of deuterium should run it for centuries. David Jones

## Cold fusion: what's going on?

**SIR**—A significant point which is not widely known, and may therefore be overlooked in neutron measurements of cold fusion rates, is the possibility of contamination by cosmic-ray-generated neutrons; these should be taken into account in the design and interpretation of experiments.

The cosmic-ray-induced neutron background arises primarily from extra-solar protons with energies above a few GeV, which can penetrate the Earth's atmosphere and the Sun's and Earth's magnetic fields<sup>1</sup>. Primaries and secondaries reaching the surface include neutrons and other energetic particles which produce neutrons in the atmosphere and the first few metres of the surface by spallation reactions. While the spectrum contains neutrons up to energies comparable to incident particle energies, a major component is due to evaporation of neutrons from struck nuclei; at birth these have energies in the range 1–3 MeV, and appear as a knee or shoulder on an otherwise continuous energy distribution. There is also a substantial component consisting of 'thermal' neutrons, which have slowed down in the environment to a poorly equilibrated thermal distribution below energies of about 0.1 eV as well as 'epithermal' neutrons whose distribution is roughly inversely proportional to the energy in the range 1 eV to 1 MeV. At energies above a few MeV, the spectrum tails off rapidly; this cascade component contains about 10% of the total. The flux of each of the low-energy components is of the order of  $10^{-2}$  neutrons  $\text{cm}^{-2} \text{s}^{-1}$  at sea level and middle latitudes.

These figures vary according to altitude (about twice as great at 1,500 m elevation), and from time to time, mostly because of variations in atmospheric density and solar and geomagnetic field intensity. The e-folding thickness in the atmosphere is about  $150 \text{ g cm}^{-2}$ , so that, for example, barometric pressure variations of  $\pm 13 \text{ mm}$  of mercury cause about  $\pm 10\%$  flux variations. Sometimes, when dealing with such a general source of neutrons, material intended as shielding, and even detector material itself, can act as a source, so that some care in this respect is called for in the measurements.

As it happens, the counting rates due to cosmic-ray-induced neutrons are of the same order of magnitude as the counting rates observed in the neutron and secondary radiation detectors in many of the measurements being made. And in detectors that disperse the spectrum, the evaporation peak in the energy distribution due to cosmic-ray-induced neutrons is at nearly the same energy as that expected from deuteron–deuteron fusion, 2.45 MeV. These observations, coupled with the (admittedly weak,  $\pm 10\%$ )

temporal (hourly, daily) variation of the cosmic-ray-induced neutron fluxes require that this background be carefully accounted for.

Comparable neutron fluxes can be generated by accelerators, isotope sources and nuclear reactors, even at considerable distances; these contaminants of neutron measurements must also be reckoned with. Obvious means for suppressing these backgrounds are time-gating of the source, monitoring spurious sources with a second detector operated simultaneously with the detector(s) near the source under investigation, or going underground—350  $\text{g cm}^{-2}$  (two or three metres of earth or concrete on all sides) should reduce the cosmic-ray neutrons by a factor of about 10.

**The following are extracts from the substantial numbers of letters from readers offering explanations of the two series of cold fusion experiments which have been generally reported.**

**Editor, *Nature*.**

**SIR**—From the newspaper accounts, the very small flux of neutrons generated during the experiment of Fleischmann and Pons is being taken as proof that their conclusion is not valid, and that nuclear reactions between deuterons do not occur under the conditions they describe.

But when the kinetic energy is as small as in their experiment, the neutron and proton components of the deuteron do not behave in the same way, because the nucleus of the target atom repels the proton but not the neutron. Thus, the neutron can be captured by the target nucleus while the proton, which remains outside the Coulomb barrier, will fly off.

This process, first recognized by Oppenheimer and Phillips<sup>1</sup> in 1935 leads to a pure (*d, p*) reaction and has a relatively high probability of occurrence, certainly much greater than that of the (*d, n*) reaction<sup>2</sup>.

It follows that if the experiments described really brought the deuterium nuclei close enough together to interact, one should expect no neutron emission and a reaction rate much higher than that evaluated on the basis of the high-energy

model.

PERONI PAOLO

Via O. Regnoli 10,  
Rome 00152, Italy

**SIR**—The only recognized mechanism for nuclear fusion at ambient temperature is that induced by negative muon binding of precursor hydrogen isotope molecules as first described by Frank<sup>1</sup> with estimates of fusion rates by Sakharov<sup>2</sup> and experimental observations by Alvarez<sup>3</sup> some 30 years ago. It is now known that more than 100 fusion events may be induced by a single muon during its lifetime of  $2.2 \times 10^{-6}$  seconds in a mixture of liquid deuterium and tritium<sup>4</sup>. If this number could be increased by a factor of 1,000, a break-even fusion reactor could be the result<sup>5</sup>.

It is tempting to interpret the recent claims in terms of this process. It should be remembered that more than 70 per cent of the cosmic-ray flux at the Earth's surface consists of positive and negative muons. There are about  $200 \text{ m}^{-2} \text{s}^{-1}$  with a stopping rate in an absorber of some  $2 \times 10^{-5} \text{ g}^{-1} \text{s}^{-1}$ . The flux may be twice as great at the altitude of Salt Lake City<sup>6</sup>, which would be equivalent to more than two muons a minute in an absorbing volume of about a litre.

The rate at which fusion events could occur is limited by the rate of formation of muon-bound molecules, which is itself a sensitive function of parameters on the atomic scale, whence its dependence on resonance effects<sup>7</sup> and temperature<sup>8</sup>. Once a muon is captured, the resulting muonic molecule is two orders of magnitude smaller than the typical lattice spacing in solids, so that free diffusion may be expected.

The fact remains that muon-induced fusion has not yet been reported in metallic compounds of hydrogen isotopes, and indeed has been considered unlikely because of the preferential capture of muons by the heavier metal nuclei. On the hypothesis that this loss mechanism is suppressed by a resonance or band structure effect in deuterium-loaded palladium, it is possible to estimate the turnover number required to explain the effects which have been reported.

Jones *et al.*<sup>9</sup> observe a neutron count-rate of  $4 \times 10^{-3} \text{ s}^{-1}$  with a neutron detection efficiency of about 1% in a volume of 160 ml. If the neutrons observed are products of the reaction, in a muon–deuterium molecule, of two deuterons to yield  $^3\text{He}$  and a 2.45-MeV neutron, one should also allow for the equally probable reaction yielding  $^3\text{H}$  and a proton, which would not have been detected by the neutron monitor. This implies five fusion events per second per litre. The required turnover number is then of the order of 100, comparable with that already known for the case of a mixture of liquid isotopes, but significantly greater than that in pure

2. Morrison, P. *Experimental Physics* Vol. 2 (ed. Segrè, E.) (Wiley, New York, 1953).

deuterium.

The consequence is that fusion induced by cosmic-ray muons cannot be excluded as an explanation of the reports of radiation effects in palladium loaded electrochemically with deuterium, although the estimates of the rate of muon-induced fusion is much less than that required by the thermal observations of Fleischmann and Pons<sup>10</sup>.

These developments emphasize the need for experimental data on the effects of negative muons in solids, especially metal deuterides and tritides, which are at present lacking in the open literature. Arrangements are in hand to investigate the reported palladium-deuterium effects with a muon source of greater flux than that of the natural cosmic ray radiation.

SIR—In my theoretical investigations of the electronic structure of the  $H_2^+$  molecule (*Phys. Lett.* **123**, 170; 1987), I have found that the two nuclei and the electron can form a collapsing quasi-molecule — a compound system whose dimensions decrease with time to zero. (The extreme case is when the electron is at the centre-point between the two nuclei.) In general, in collapsing molecules like these, the repulsive Coulomb interaction of the nuclei and the gas-kinetic pressure of the electron are less than the attractive Coulomb forces between the two nuclei and the electron. The closest approach of the two nuclei depends on the initial state of the electron, its binding energy and the mean value of the kinetic energy in particular.

The probability of the tunnelling effect is therefore identical with the probability of formation of a collapsing quasi-molecule. Thus it is clear that the electrons present in the matter are responsible for the Coulomb-barrier tunnelling, and that the process which has been observed depends on quasi-molecular systems.

SIR—Reports of the experiments by Fleischmann and Pons contain a paradox

— that, if fusion reactions do occur in them, either too much energy is liberated or too few neutrons are detected. I wish to suggest a possible explanation.

I start from the hypothesis that the palladium contains regions where the density of deuterons is sufficiently great for d-d fusion to occur by one of the reactions leading either to  $^3H$  and a proton or to  $^3He$  and a neutron. The product particles will be produced within a region where the density of other particles is very great. The mean free paths of the particles will then be very small, and it appears reasonable to assume that even though these high-density regions will be geometrically small, they will be so optically large that even the most penetrating particles, such as neutrons, will remain trapped inside them. In this situation, the particles produced by fusion reactions will undergo multiple scattering collisions until a new reaction occurs.

Several such reactions are possible, including fusion reactions of deuterons with  $^3H$  and  $^3He$  (yielding  $^4He$  and a neutron or proton respectively) and the radiative capture of protons or neutrons by deuterons. These reactions are exothermic, releasing large amounts of energy.

It is crucial that these processes can also form multiplicative chains, especially if the  $\gamma$ -ray photons released by radiative capture reactions yield further energetic neutrons and protons by the photodisintegration of deuterons. The reaction chains will come to an end only when reactive particles escape from high-density regions to those where the density is insufficient to sustain them.

The main products of these reaction chains will be  $\alpha$ -particles, but the reactive particles such as neutrons and  $^3H$  will only infrequently be released to the environment.

## Pulsar formation

SIR—Lindley<sup>1</sup> states that the report<sup>2,3</sup> of a half-millisecond pulsar in the remnant of supernova 1987A "has surprised everybody and could, if confirmed, stand theory on its head". He has apparently overlooked several papers (refs 4 and 5, for example) suggesting that pulsars may form directly as rapidly rotating neutron stars "in original spin" with weak magnetic fields, without the need for "resurrection" after birth as a slow rotator followed by subsequent decay of the magnetic field and spin-up by accretion of matter from a companion star<sup>4</sup>.

Even before the discovery of millisecond pulsars, we discussed<sup>5</sup> the question of why collapsed stars rotate so slowly,

and pointed out that if there was significant mass ejection during the formation of a neutron star, and if it had a strong magnetic field, it was likely to be born spinning slowly. We argued, furthermore, that if the progenitor giant core of the neutron star has a strong magnetic field, it is likely to have been rotating relatively slowly, as the magnetic field would have enhanced transfer of angular momentum from it to the envelope during earlier evolutionary phases. We concluded that if weak-field neutron stars could form at all, they would be born spinning fast. If the optical emission from the half-millisecond pulsar arises from incoherent synchrotron radiation at the light cylinder, and scaling by the optical luminosity and magnetic field of the Crab pulsar, it follows that the half-millisecond pulsar indeed has a weak magnetic field of  $B \sim 10^8$  gauss.

With the discovery of six millisecond pulsars (with periods  $\leq 12$  ms), of which four are in binary star systems, several authors concluded that 'resurrection' was required to account for their observed properties. A key requirement for the 'resurrection' model is that the magnetic field of neutron stars must decay on a timescale of a few million years. But arguments against significant neutron-star magnetic-field decay have been proposed (for example, ref. 8). Furthermore, calculations by Sang and Chanmugam<sup>9</sup> showed that there are serious difficulties with all models so far proposed for field decay. In addition, there is no satisfactory detailed model that explains how single millisecond pulsars can be formed from binary star systems. Even in the case of PSR1957 + 20, where there is evidence of matter evaporating from the companion, the spin-down rate indicates insufficient energy loss from the pulsar to evaporate the entire companion star. When combined with all the difficulties of the 'resurrection' model, the discovery of the half-millisecond pulsar seems to provide substantial further support for the view that at least some millisecond pulsars can be born "in original spin".

# SCIENCE & GLOBAL SECURITY

*The Technical Basis for Arms Control and Environmental Policy Initiatives*

## Aims and Scope

**Science and Global Security** is an archival source for high-quality, peer-reviewed scientific analyses relating to arms control and global environmental policy. Its goal is to improve the quality and the cumulative impact of communication on these subjects between the scientific communities of East and West and to help create a common understanding of the technical basis for new policy initiatives. The journal will be published in Russian as well as in English.

The articles will be written so that their essential conclusions can be understood by non-specialists while containing enough technical detail so that their results can be reproduced.

## An Invitation to contribute

The editor welcomes articles by scientists and other analysts from both Western and Eastern-bloc countries including jointly authored articles. Manuscripts should be sent in triplicate to the Editor, who, after an initial screening, will send them for review. The Editor has final say on the suitability for publication. For a complete set of Notes for Contributors, write to the Editor or the Marketing Department at the address below.

## Editor

# On the bright side

Steven Rose

**Biology and Freedom: An Essay on the Implications of Human Ethology.** By S.A. Barnett. Cambridge University Press: 1989. Pp. 376. £32.50, \$39.50.

I'M LEERY about books with the words 'biology and . . .' in the title — they tend to contain yet more angels-on-a-pin discussions by philosophers about the ethical implications of science-fiction genetics, or sociologically naive speculations by biologists about the inevitability of war, the nuclear family and capitalism. *Biology and Freedom* comes as a refreshing contrast. Professor Barnett is a distinguished ethologist of the school which pre-dates the present-day obsessions with optimal foraging strategies, cost-benefit analyses and genetic fitness calculations, and his previous books include an authoritative study on the social behaviour of the rat. As anyone who has had the good fortune to hear one of his forceful contributions to that great Australian radio institution, *The Science Show*, will know, he does not suffer fools lightly. But his new book goes beyond the mere debunking of certain currently popular biologicistic follies, to offer instead a vision of a humanity set free by our very biological constitution.

Barnett's intentions are perfectly revealed in the epigram from Shaw with which the book opens: "Is human nature incurably depraved? If it is, reading this book will be a waste of time". The first two-thirds of the subsequent text is devoted to a critique of those claims for such incurable depravity that have found their way into three decades of biological textbooks and Sunday-newspaper popularizations. The final third offers us the author's alternative vision. The targets for his criticism are designated respectively *Homo pugnax* (the claim that human beings are innately violent and aggressive); *Homo egoisticus* (the claim that we are innately selfish); and *Homo operans* (the claim that we are innately greedy).

Behind the first title shelter the pre-sociobiological generation of pop-ethologists such as Lorenz and Ardrey (in contradistinction to the recent obituaries, Barnett has no hesitation in referring to Lorenz's youthful Nazi enthusiasms and more recent New Right leanings). The claim of selfishness, of course, refers to the DNA-centric view of the universe offered by sociobiology's 'modern synthesis', and provides Barnett with the context for a synoptic account of neo-darwinian evolutionary theory. Greediness turns out to mask the skinnerian vision of human beings as driven exclusively by contingencies of reinforcement, of reward and punishment, as epitomized in the utopian/dystopian

vision of *Walden Two*. There have been numerous critiques of these positions, of course. E.O. Wilson himself described the writings of Ardrey and Lorenz as "mere advocacy". The sociobiologists have been criticized on scientific, ideological and philosophical grounds (this last especially by Philip Kitcher in his book *Vaulting Ambition*, which oddly does not appear in Barnett's extensive bibliography). Chomsky's polemic with Skinner is well known.

Barnett, bringing to these debates a combination of deep familiarity with the ethological and anthropological literature and a gentle wit, has little difficulty in exposing the shallowness of each of the three visions of humanity. He leaves unaddressed, however, the question of just why these views have achieved the popular resonance, and their authors the fame, that they undoubtedly have. Just why should such poorly predicated and evidentially weak ideas continue to be taken seriously? For some, the answer lies in the part they play in helping set political agendas; Barnett allows his readers to pose and answer such questions themselves. This reticence may be appropriate in a book which is evidently designed, as this one is, to serve as a teaching text in courses in the human sciences as well as for a wider audience.

It is to the last third of the book that one must turn to move beyond critique and to

arrive at the author's own vision of human nature, the vision which informs the book's title. Reductionism and determinism fail as methods of understanding the human condition because in considerable measure our future is undetermined — we make our own history, though in circumstances not of our own choosing. Human beings are playful animals, curious animals, animals who make music, animals for whom work is not necessarily labour but can be liberating, unalienating. And human beings are also animals who teach. The reciprocal pleasures of teaching and learning, of the relationships between adults and children, are beautifully conveyed, both in prose and in many of the photographs which enliven the book.

Barnett's message is unfashionably optimistic. Certainly science and technology are associated with great horrors — and with the peculiarly distorted visions which the first portion of the book is concerned to dispose of. Equally certainly, human perfectibility is not an option. When television screens are full of images of war and starvation, when fanatical fundamentalists can condemn to death a writer who dares to laugh, it is hard to hold on to a utopian perspective. But Barnett remains unshakably a progressive. We do our present age an injustice, he argues, if we cling to ideas of human beings as greedy, violent and selfish, and fail to realize not only how far we have to go, but also how far we have already travelled towards a free, egalitarian and democratic society, a society which it is in accord with our biological natures to create. □

Steven Rose is Director of the Brain and Behaviour Research Unit, The Open University, Milton Keynes MK7 6AA, UK.

Threatening gesture — the male three-spined stickleback *Gasterosteus aculeatus* in a posture that intimidates other males of the same species, here seen intimidating its own reflection. The behaviour is innate, and depends on both internal motivation and external sensory factors. The picture is taken from a reprint of *The Study of Instinct* by Nikolaas Tinbergen, who died last year (see S.A. Barnett's obituary in *Nature* **337**, 509; 1989). The book contains the original text written in 1949, along with an introduction added in 1969 and a brief 1988 preface. Publisher is Clarendon, price is £12.95.

## Dirty deeds

John H. Simpson

**Pollution of the North Sea: An Assessment.** Edited by W. Salomons, B.L. Bayne, E.K. Duursma and U. Förstner. Springer-Verlag: 1988. Pp. 687. DM 198, £65.

LAST summer the seals of the North Sea died in their thousands as an epidemic of canine distemper swept through a population whose numbers had previously been increasing. The episode, accompanied by intense media attention (it was the silly season), served to alert us all to pollution in the North Sea.

Ironically, it now seems unlikely that there was any direct connection between the seal deaths and toxic pollutants. But the plight of such appealing creatures (jelly fish would not have been the same) served as a powerful focus for public fear that something is seriously wrong in the ecosystem of Europe's shelf seas, and that remedial action is needed to avoid catastrophe. Marine scientists are now rightly being pressed to state what exactly are the pressures on the North Sea and to what extent they constitute an urgent threat. In *Pollution of the North Sea*, a wide-ranging and timely survey, the editors have attempted to assemble the best available

Disastrous legacy — the explosion on Piper Alpha in July 1988 killed over 150 workers and may have released toxic compounds into the North Sea.

scientific answers to these questions, and to express what they identify as the remarkable consensus amongst the scientists involved as to the vulnerability of the North Sea and its finite capacity to assimilate waste. That does not mean that there is no disagreement about the details; with so little knowledge in some areas there is still plenty of room for different interpretations and hypotheses about mechanisms. But there is a determination manifest in this volume to establish a scientific assessment of the problem undistorted by national political pressures.

With 40 separate papers by more than 70 authors, the book covers most aspects of the subject. The first section reviews the basic physics, chemistry and biology of the North Sea, giving due weight to the importance of suspended particulates — these absorb many of the pollutants, carrying them into the sediment where they are exposed to diagenetic processes before possible resuspension brings them back into the water column. Also here is discussion of the role of the surrounding sediment traps (salt marshes, estuaries and fjords) which act as sinks for pollutants, and of the natural variability of the system which so much complicates the problem of detecting the incipient consequences of pollution.

Section 2 provides a useful compendium of facts and figures on the main inputs of pollutants into the North Sea including, for example, best estimates of how much cadmium, mercury and lead (the latter mainly from the atmosphere) are entering each year. Some of the inputs, notably of organic pollutants, are hard to quantify. It is difficult to determine the concentrations of such a large number of compounds, and there are uncertainties surrounding single catas-

trophic events such as the Piper Alpha disaster, which may have resulted in the release of several tons of polychlorinated biphenyls, and the recent loss of a large quantity of Lindane in the Channel. The inputs of nutrients, on the other hand, are certainly increasing dramatically; the amounts of nitrate and phosphate coming from the Rhine double about every 15 years, and there is evidence of consequent eutrophication in the German Bight.

Pollutant effects in particular areas and on particular sections of the biota are considered in more detail in the two final sections. We learn, for example, about the specific problems in marginal areas such as the Wadden Sea, where pollution pressures are most intense and where we might look for early warning of the consequences. The Wadden Sea offers some of the few examples (for instance decline of the harbour seal, and changes in the populations of spoonbill and sandwich tern) where we have good evidence of the impact of pollutants on particular species.

Given so many contributors, the scientific quality of this large volume is inevitably somewhat variable. Although the choice of material is, on the whole, balanced, there has been no attempt at synthesis in the form of overall and sectional synopses. This, I fear, will make the book harder to use and less accessible to the non-specialist than it might have been. Nonetheless, *Pollution of the North Sea* is a unique and valuable compilation of material. It will serve as a vital source of reference for those involved in the science and management of the North Sea, and in the presentation of the attendant issues to a wider public. □

# The opposite of knowledge

John S. Rigden

**The Privilege of Being a Physicist.** By Victor F. Weisskopf. W.H. Freeman: 1989. Pp.235. \$17.95, £12.95.

IT is appropriate that the most prominent word in the title of Victor Weisskopf's book is *Privilege*. Through talent and hard work, Weisskopf has gained an international reputation and has attracted many honours; yet he is that rare kind of man who regards it all as a privilege.

For readers familiar with two of Weisskopf's earlier books, *Knowledge and Wonder* (Doubleday, 1962) and *Physics in the Twentieth Century* (MIT Press, 1972), the appearance of this new work will be a happy event. It brings together 16 essays: two were written specifically for the book, the others have mostly appeared over the past ten years (although four of them have been expanded for the present collection). The subjects covered are some of the principal ideas of twentieth-century physics, two of the physicists who participated in the creation of those ideas, and the relationship of science to culture and to society.

The theory of quantum mechanics was created during the years 1925–1927. For those who followed events, it was a time of intellectual exhilaration and purgation. Conundrums that had plagued physicists during the early years of the twentieth century were suddenly resolved — provided they were willing to accept nature on entirely new terms and think in entirely new ways. To engage one's mind in thinking about such a conceptually rich subject, and to do so in the fundamental ways that were required to create the formalism of quantum mechanics, is an experience that alerts the mind to the broad place of physics in human activities.

With just a touch of sadness, Weisskopf has acknowledged that he came to physics "three years too late" — too late, that is, to be an active participant in the creation of quantum mechanics (*Physics in the Twentieth Century*, p.4). Starting in 1929, however, he made many seminal contributions through the application of quantum mechanics to our understanding of matter. Moreover, he has been one of those theoretical physicists who has thought deeply about the ideas of quantum mechanics and about the interpretation of this incredible theory. In addition, he knew personally men such as Bohr, Heisenberg and Pauli who were the architects of quantum mechanics and he bears their influences. This is the background that Weisskopf brings to his writing.

Although they were written for the

general reader, scientists will also find the essays edifying. Weisskopf does not present physics as an activity isolated from values and emotions. Quite the contrary. He shows us how physics and the humanities arise from the same universal values and complement each other. Teachers at all levels would be well advised to read and ponder the contents of the book. Too often science instruction takes the form of transmitting bits of knowledge that are isolated from any scientific, cultural or human context. But such bits of knowledge provide students with no under-

From *The Privilege of Being a Physicist*

Weisskopf — a rare kind of man.

standing of science. Weisskopf goes further: in the chapter "Teaching Science", he asserts that "science is the opposite of knowledge" and portrays science as the product of curiosity and questioning which can lead to a "fuller, more meaningful life".

Weisskopf is at his best when he writes about the ideas of physics. In "What is Quantum Mechanics?", written specifically for this collection, we learn how "the primal shapes of nature" bring stability to atoms and how the uncertainty inherent in nature really brings the certainty that renders all atoms of a given element identical. This essay, along with "What is an Elementary Particle?", "Contemporary Frontiers in Physics" and "The Origin of the Universe", reveals not only the depth of Weisskopf's understanding, but also demonstrates his expository skill. For

their clarity and insight, these essays are outstanding.

Wolfgang Pauli and Werner Heisenberg are each the subject of Weisskopf's attention. Pauli is typically the subject of many anecdotes; Weisskopf adds to them and, in the process, brings insights to Pauli's intriguing personality. In the case of Heisenberg, Weisskopf's admiration of the man prompts an explanation of his wartime activities; this account is based largely on *Inner Exile* (Birkhäuser, 1984), the recent book by Heisenberg's widow, and in comparative terms it is somewhat more generous than the findings of contemporary historians such as Alan D. Beyerchen (*Scientists Under Hitler*; Yale University Press, 1977).

Implicitly, Weisskopf extends the same generosity to American physicists. If quantum physics can be said to have had a determining influence in Weisskopf's life, so can his experiences at Los Alamos. In 1943, Hans Bethe persuaded Weisskopf to join the team at Los Alamos and work on the development of the atomic bomb. Weisskopf became one of the prime movers in the Manhattan Project. When the war ended, however, he refused to participate in the further development of nuclear weapons; rather, he helped to form the Federation of Atomic Scientists, a group whose purpose was to alert the public to the dangers of nuclear war. In making this decision, Weisskopf differed with many of his fellow physicists who on the one hand called for an end to the arms race and on the other continued to develop successive generations of nuclear weapons. As the history of the post-war period is now being written, it is apparent that one of the primary driving forces of the arms race has been the ability and willingness of physicists to realize technical possibilities which have inevitably proved irresistible to political and military leaders. In this regard, Weisskopf might have expanded his concept of the privilege of being a physicist to include more directly and more insistently the idea of responsibility. As for himself, Weisskopf's responsibility has been fulfilled: in the book he continues to call for an end to the madness of nuclear weapons.

The essays were written over a period of years, so there is some repetition; I suggest that each of them should be read individually (rather than consecutively). In this fashion, they will reinforce each other while each is savoured. □

John S. Rigden is Director of Physics Programs at the American Institute of Physics, 335 East 45th Street, New York, New York 10017, USA.

• Part 2 of Solly Zuckerman's memoirs, *Monkeys, Men, and Missiles: An Autobiography 1946–1988*, has been published in the United States by W. W. Norton. Price is \$22.50. The British edition was reviewed by William Cooper in *Nature* 336, 285 (1988).

## Pleasing all of the people

C. J. Gilmore

**General Chemistry.** By P. W. Atkins. W. H. Freeman: 1989. Pp. 989. Hbk \$49.95, £32.95; pbk \$39.95, £16.95.

WRITERS of textbooks on general chemistry have a problem that their colleagues in subjects such as biochemistry, cell biology and computer science (to name but three examples) do not have. Chemistry is an old subject, many of its foundations being laid in the nineteenth and early twentieth centuries. Thermodynamics, for example, is a product of the second half of the nineteenth century, though it remains as relevant now as it was 100 years ago. Quantum mechanics, as studied by undergraduate chemists, is over 50 years old, but is likewise a vital ingredient of modern chemistry.

At the same time the subject itself has not stood still. So how does one teach both the old and the new, and how is the old kept fresh and stimulating? And then there is the problem of conflicting requirements. Scottish, English and North American universities all have different entry standards, and give courses in the first year that demand different prerequisites, so the author of a general text has to decide the potential market that is being addressed — it is impossible to please all of the people all of the time. The market for such broad-brush textbooks is enormous; most publishers have one or more appropriate titles in their lists, yet most of them are virtually indistinguishable in their approach and presentation.

Peter Atkins is well known as an author of physical chemistry textbooks. His *Physical Chemistry* (Oxford University Press, 1986) is now in its third edition and is widely used by relatively advanced undergraduates. Another of his books, *Molecules* (W.H. Freeman, 1987), presents the concepts of molecular shape, so important in biological aspects of chemistry, in a novel and entertaining way. Atkins also has strong views about the topics which he feels should be taught; in an article published in 1987 (*Chemistry in Britain* 23, 640–641), he argued the case for teaching through computer modelling and provoked considerable debate. We have, therefore, an experienced author with some controversial views — in turning to general chemistry, has he produced something different from the standard texts?

The initial impressions are encouraging. The book's presentation is attractive, with one-third of each page reserved for a column which displays diagrams, photographs and other figures. Colour is used

well, although the pale-blue background to photographs of apparatus sometimes obscures the colour changes that are being shown. The pictures of molecules are especially good, with space-filling models used as in *Molecules*. This new book must rank as one of the best-produced chemistry texts I have ever seen.

The content, however, is pretty conventional with none of the innovation that one might have hoped for. By British standards, organic chemistry is handled only superficially: there is a lightning tour of the subject scampering through everything from alkenes to nucleic acids in two chapters of 70 pages. There is no attempt to introduce mechanism — yet how can students ever make sense of organic chemistry without it? For inorganic chemistry there is a similar tour of the periodic table, and these two factors alone make it clear that a North American audience is what the author and publisher have in mind. As

one might expect, physical chemistry fares best; over two-thirds of the text is devoted to the subject, with a commensurate increase in the academic standard.

There are some good touches — a description of how to quote the correct number of significant figures in numerical calculations, and a massive number of problems and worked examples. Indeed, the book is (or will be) accompanied by a study guide, an instructor's manual, a solutions manual (only the odd numbered numerical exercises have answers in the book itself), a laboratory manual, a computer test bank, a video demonstration and overhead transparencies. My prognostication is that, in a very full market place, *General Chemistry* is likely to be a best-seller in North America but less used in Britain.

C.J. Gilmore is a Senior Lecturer in the Department of Chemistry, University of Glasgow, Glasgow G12 8QQ, UK.

## A closer look

Tom Mulvey

**Principles of Electron Optics.** By P.W. Hawkes and E. Kasper. Academic: 1989. Two volumes, pp. 1,188 plus indexes. Vol. 1 £37.50, \$84.50; vol. 2 £37.50, \$79.50; the two together £65, \$140. A third volume is in preparation.

IT IS 56 years since Ernst Ruska built the electron microscope that broke through the resolution barrier set by the optical microscope and later earned him the 1986 Nobel prize in physics. These instruments now have a huge influence on science and technology, diagnostic medicine, crime detection and food technology, and hence on society itself. The design of modern electron optical microscopes and the interpretation of the resulting atomic images is a scientific challenge. Electron microscopy makes great demands on theoretical physicists because it embraces the whole range of classical and wave optics, newtonian and relativistic mechanics, and quantum physics. Many former theoretical speculations such as 'quantum wells' can now be observed routinely.

A lot of books on the subject have appeared in the past, but *Principles of Electron Optics* is the first attempt, since the advent of the digital computer, to cover the entire subject systematically and critically. There are three volumes, each of about 600 pages. The first two, *Basic Geometrical Optics* and *Applied Geometrical Optics*, are reviewed here; Vol. 3, which will be concerned with wave optics, image interpretation and electron holography, is in preparation. The authors assume that the reader has a knowledge of physics and mathematics to

degree level, and aim to provide a self-contained, modern account of their subject for anyone 'involved with electron beams of modest current density in the energy range up to a few megaelectronvolts'.

In Vol. 1, the emphasis is on basic principles rather than instrumental applications. This, however, is no mere repetition of material to be found in textbooks — Hawkes and Kasper have reworked their material into a coherent and unified whole, making a careful appraisal of the best way to approach a given topic. Although the role of traditional analytical methods is clearly brought out, the impact of computer methods is rightly stressed. The authors compensate for some inevitable omissions by providing a comprehensive set of notes and further references directing the reader to the original literature. Volume 2 deals with the application of the theory to the calculation of the optical properties of lenses and other electron optical elements. Particularly valuable is the chapter on electron guns, a difficult and widely misunderstood subject.

This is a monumental and timely work — well researched, carefully proof-read, and marked by clarity of thought and expression. That it is in English and uses SI units is an enormous advantage for today's worldwide readership in electron optics and microscopy. It merits close study by all physicists and engineers concerned with the subject, and indeed by all those who wish to gain an insight into the power of theoretical physics to deal, often in a deceptively simple way, with the complex situations that now arise routinely in electron microscopy. □

Tom Mulvey is Emeritus Professor of Electron Physics at Aston University, Birmingham B4 7ET, UK.

# The American Society for Cell Biology

announces the publication of a major new scientific journal

## CELL REGULATION

Editor-in-Chief

***Erkki Ruoslahti***

La Jolla Cancer Research Foundation

### Associate Editors

Alfred G. Gilman, University of Texas Southwestern Medical Center, Dallas

Joan V. Ruderman, Duke University, Durham

Michael B. Sporn, NCI/NIH, Bethesda

Michael H. Wigler, Cold Spring Harbor Laboratory, New York

Keith R. Yamamoto, University of California, San Francisco

Carl-Henrik Heldin, Ludwig Institute, University of Uppsala, Sweden

Masatoshi Takeichi, Kyoto University, Japan

CELL REGULATION will publish articles dealing with a broad range of topics including all aspects of cell regulation and the reception, transduction and integration of information. It will deal with the molecular biology and physiology of receptors, transducing systems, informational molecules and their relevance to the growth, development and physiology of prokaryotic and eukaryotic cells.

Topics represented in CELL REGULATION will include:

- gene regulation
- cytoskeletal proteins
- phosphorylation, Ca-binding regulatory proteins
- intracellular signaling, phosphoinositol pathway
- oncogenes, GTP-binding proteins
- cell adhesion proteins
- receptors
- growth factors, hormones

Publication will begin with an issue to be mailed to all ASCB members in the fall of 1989.

For information regarding manuscript submissions and subscriptions, please contact:

ASCB, 9650 Rockville Pike, Bethesda, MD 20814 (301) 530-7153 FAX (301) 530-7139

Reader Service No.8

# RUN ALL THIS OVER LUNCH?

## *Molecular dynamics*

Molecular dynamics study of gramicidin (a cyclic polypeptide with 176 atoms) using AMBER. 2000 steps of 0.0005 picoseconds with velocity scaling and distance-dependent dielectric.

## *Quantum mechanics*

81 selective optimisation calculations on methanol/methyl iodide using AMPAC. The results were used to generate the methanol/methyl iodide SN2 reaction surface in Chem-X.

## *Conformational analysis*

Conformational analysis of aspartame (38 atoms), considering 30° steps about each of four bonds. 20736 conformations were generated and the corresponding Van der Waals energies calculated.

# MITIE CAN!\*

Chemical Design's MITIE compute-server is a highly cost-effective solution for chemists who need results *fast*.

Whatever the application area, the MITIE massively increases system throughput. For example, quantum mechanics calculations on multiple structures can be run simultaneously, allowing the rapid generation of reaction surfaces. Independent dynamics runs can be made on all loops of a protein at the same time. A parallel implementation of powerful rule-based conformational analysis routines exploits multiple processors to minimise the time taken for individual tasks.

The MITIE is designed specifically for large computational chemistry calculations, with up to 36 IMS T800 transputers configured in parallel. It runs not only the powerful Chem-X modelling

software, but also a range of popular public-domain quantum mechanics and molecular dynamics programs. Other programs written in standard FORTRAN may also be run on the MITIE.

The MITIE can be configured either as a stand-alone superworkstation or as a multi-user network-based compute-server with a maximum performance of 360 MIPS. But if you prefer real examples to theoretical performance figures, the examples above speak for themselves.

With over six years experience in molecular modelling systems development, Chemical Design has the solutions to meet real user requirements. So if you want to expand your computer resources, choose the really cost-effective solution: a MITIE system from Chemical Design.

*The unique Safety Key for MultiDrive™ XL prevents overloading instrument systems and ensures your personal safety.*

## Power alone isn't the key

It's how power is channeled and controlled that makes the difference.

With 30 years' experience in electrophoresis we've learned what a difference it can make when power settings are optimized and accurately controlled. With you in mind, we incorporated all this experience into one power supply: MultiDrive XL.

### Versatile and easy to program.

MultiDrive XL can power most electrophoretic techniques including isoelectric focusing, SDS-PAGE, DNA sequencing and blotting. You can choose either the MANUAL or PROGRAM mode to run your experiments.

### Accurate and reproducible.

With its perfect memory, MultiDrive XL will accurately control even your most sophisticated methods. And you can use volthour or milliampere-hour integration to compensate automatically for differences in gel thickness and ionic strength or temperature.

### Safe.

The most important key to a successful electrophoresis experiment is still your personal safety. You can always expect to find the best safety features in all our power supplies.

For more information consult your Pharmacia LKB representative or ask for our new power supply guide.

*The new MultiDrive XL (3500 V, 400 mA) improves accuracy and reproducibility with automated control.*

*P.S. The real power is in your results.*

# Collaboration in a wider Europe

Europe is in a mood to collaborate in research, as in much else, but doubts persist about the proper framework. This survey of science in Europe may resolve some issues.

EVERYBODY agrees that Europe is in transition, but the end-point is undefined. That is the starting point for the survey of science in Europe that occupies the following pages. Several important influences, cultural, economic and political, have conspired to provide an impetus for change that, in the long run, will help determine what the world is like, but the most interesting of them is the growing inclination of those who live in Europe to regard themselves as members of a community whose common interests transcend the chauvinistic differences that have bitterly divided them in the past.

That is why this survey differs markedly from others in this biannual eight-year series. It is not so much a record of achievement and disappointment in research, as of the mechanisms by which Europeans collaborate. And because there is so much going on, this will seem even more neglectful than previous surveys of important institutions contributing to the increasing cohesion of European science. It is hoped that those who are concerned with these institutions will not be too deeply offended.

Many of the institutions that now exist to foster European collaboration have their roots in the period immediately after the Second World War, and in the then common revulsion against the folly that had brought most European states economically to their knees. But there is an important sense in which the lesson also derives from the earlier 1914–18 war. In the settlement of that disaster, states called great powers redrew the map of Europe artificially while demanding that Germany should pay for the cost of the trouble it had caused — in retrospect a device for creating the conditions that made the Third Reich possible. That seemed a bad precedent in 1945. But by then, the great powers of the time had already (at Yalta) redrawn the European map so as to divide East from West. All the more necessary that the other ingredients of the settlement after 1918 should be avoided.

That is why the past 40 years have seen so many attempts in Western Europe to create a framework in which national interests and cultural differences would be subsumed within a common purpose. In rapid succession, there were formed the Western European Union (concerned with mutual defence), the Council of Europe (to foster common social and legal standards) and the succession of economic communities, which were at first concerned with commodities such as iron, steel and nuclear energy, but now, as with the twelve-member EEC, are concerned with the whole of economic activity. (The second half of this survey, beginning on page 726, deals with EEC science and what should be done about it.)

Collaboration is evidently infectious. The dramatic proof of that is Mr Mikhail Gorbachev's recent talk of the

"common European home". Gorbachev, who is not naïve, no doubt has many objectives. But suddenly, it seems, everyone wishes to collaborate. Poland, Hungary and Yugoslavia are talking of full membership of the Council of Europe, its Convention on Human Rights apparently not an obstacle. Turkey has applied for membership of the EEC, Austria is wondering whether to do so, while the Scandinavian countries and Switzerland may yet have a close relationship with the EEC.

Where will it end? And will the outcome revitalize European science? The continent (including its offshore islands) has never been full of optimists, which is why there is also now as great a need of realism. It is easier to decree collaboration than to ensure that it succeeds, especially in the practice of scholarship and research — and when the decrees are made by politicians. Here are some challenges and rules for optimists:

■ **Higher education.** In the 1860s, the great Ernst Mach left Vienna to teach at Prague, which is not very far away, but that would not now seem a natural move. Europe now has too many separate university systems. Even within the EEC, too many universities are too tightly in the pockets of their governments, national or even regional, yet there are no plans for integrating them. So how, and when, to make progress towards a wider framework?

■ **Basic research.** There are two frameworks of collaboration — within the EEC, and more extensive (typified by CERN and the European Science Foundation). Within the EEC, the European Commission should in future play a stronger part in supporting basic research (see page 734), but that may be detrimental to wider collaboration. How are those desirable goals to be balanced?

■ **Applied research.** The EEC centrally supports research intended to put its industry in better shape, but there are contradictions, not least that with the principle that successful industrial companies stand on their own feet, paying for their own research and development. EEC practice is also a potential impediment to wider economic collaboration. How will those issues be resolved?

In all this, there is a crucial issue too often overlooked — the danger that European collaboration in some defined framework will be exclusive of the world outside. The danger that the EEC will emerge from the upheaval planned for 1992 as a high-tariff chauvinistic group of self-satisfied states is the most immediate. Those who would suffer most would be those stranded within the tariff barriers, but Europe's relationship with the outside world would also be seriously damaged. That is why the EEC's goal of a single market, promised for 1992, is not in itself sufficient. It also matters crucially whether it is an out-going grouping. □

# Once-lame duck now exudes self-confidence

## Paris

THE European Space Agency (ESA) is "the best example of what European collaboration can achieve", says its director-general, Reimar Lüst. "We are not only involved with basic science and new technology, but are faced with heavy competition, unlike the European fundamental research facilities, which have life easy."

Yet, with only one-tenth of the budget available to the US National Aeronautics and Space Administration (NASA), ESA has become a force to be reckoned with.

The collaboration began in the early 1960s, under the impetus of European scientists, as the European Space Research Organisation (ESRO) and the European Launcher Development Organisation (ELDO). ESRO was highly successful, developing a series of scientific satellites launched by NASA, and establishing specialized space-science centres in the Netherlands, Italy and West Germany. But ELDO was a damp squib and failed to produce a viable launcher.

ESRO and ELDO metamorphosed into ESA in 1975 with the signing of a convention by 11 European countries: Belgium, Denmark, West Germany, France, Ireland, Italy, the Netherlands, Spain, Sweden, Switzerland and the United Kingdom. Austria and Norway joined last year, when Finland became an associate member.

ESA has taken European space capability out of a purely scientific domain, dependent on US launchers, into telecommunications, Earth observation and meteorology. A major step was the establishment, in 1980, of Arianespace, a commercial joint-stock company (59 per cent owned by France) responsible for the exploitation of ESA's successive generations of Ariane rockets. With a record of only four failures out of 30 launches, Arianespace now has 50 per cent of the world commercial launch market.

Once the heart of European collaboration in space, basic science now represents only 12.4 per cent of ESA's total 1,573 million ECU budget. But the science programme, like the general budget, is mandatory. All member states have to contribute in proportion to their gross national product. Consequently, unanimity is required whenever policy or budget decisions are put to the vote at ministerial-level meetings. Last year,

Britain found itself isolated when it initially refused to agree a 5 per cent annual increase in the science programme budget, holding up scheduling and potentially threatening some projects.

The science programme is constructed around a long-term plan, put together by the science programme committee and covering the next 15 to 20 years. The current programme, called Horizon 2000, was jubilantly approved at the 1985 ESA council meeting at ministerial level, in Rome. It comprises four 'cornerstone' projects in solar terrestrial physics, a comet nucleus sample return mission, an X-ray multi-mirror mission and a sub-millimetre astronomy project.

For Lüst, the science projects often help the push towards new technology — as was the case with the optics of the Hipparcos astronomy satellite, one of

adequate infrastructure.

But ESA's most controversial and expensive move, where tangible returns are less certain, came in November 1987 when a majority of member states backed a programme for manned space missions. Together, ESA's contribution of an attached laboratory to the NASA Freedom space station, a free-flying laboratory and a polar platform, now account for almost 40 per cent (609 million ECU) of its total budget, while the French-conceived Hermes space plane and the Ariane 5 rocket needed to launch it swallow a further 10 per cent (153 million ECU). Britain has opted out of these projects, so British companies will benefit hardly at all from the contracts.

Lüst applauds the decision to enter the manned space arena. "The trend will move towards robotics, but this will take 20–30 years. Meanwhile, there is still a need for people." He argues that the Hubble Space Telescope, due to be launched at the end of the year, has been designed to last for ten years. But if it needs repair during that time, "it may be more expensive to recover than to repair it in orbit."

To Lüst, there is no doubt about the value of ESA for European science and industry. "The system really works. On satellite projects, probably two dozen truly European teams work together. Europe needs a drive on high technology and ESA provides an excellent vehicle for this." He is proud that ESA scientists and engineers are already exploring new frontiers such as robotics, synthetic radar and laser applications for optical communication between satellites.

"We also need more civil and less military research", says Lüst. Since 1980, the ESA convention has declared the purpose of its activities as exclusively peaceful, a constraint that has strung out negotiations with NASA over the Freedom space station. He also feels that space science is good value for money. "Europe's gross national product is about three-quarters of that of the United States, yet we spend only one-eighth per capita of what the United States spends on civil research. Only 0.05 per cent goes on space technology. Even if the figure doubled it would still be all right."

But last year, ESA found its member states less united and resolute than in 1985 and is due for a new round of debate when it seeks backing for the Data Relay Satellite, which, according to Lüst, is an essential element of the Columbus package.

Meanwhile, Columbus is not yet out of the woods. President Bush has still to persuade Congress to go ahead with Freedom. But, says Lüst, if the United States reneges, ESA will continue alone, although it may be more reluctant to cooperate with NASA in the future.

Peter Coles

ESA's satellite-view of Europe. Europe could comfortably double spending on space, says ESA's director-general.

four 'medium-sized' missions planned under Horizon 2000. (Hipparcos is due to be launched in a few weeks.) Two others, Ulysses and the Space Telescope, are joint ventures with NASA, and have had to stay on ice for almost three years since the suspension of shuttle launches in 1986. Future ESA missions will be launched by its own Ariane rockets.

The applications programmes are where national passions, purses and fantasies find direct expression. Participation is optional, but ESA ensures that backing nations receive industrial contracts in proportion to their investment.

Telecommunications satellites have been supported by all member states and, with Earth observation and microgravity projects, have stimulated the European Commission to become involved to work out norms, organize networks of users and to improve what it considers to be an in-

## EUROPEAN SOUTHERN OBSERVATORY

# Southern sky surveyed

## Garching, near Munich

CREATED out of the ruins of European astronomy after the Second World War with the help of the Ford Foundation, the European Southern Observatory (ESO) has become one of the most successful undertakings in European science. After years of solid contributions to optical astronomy, ESO now stands poised to seize the initiative internationally with its planned Very Large Telescope (VLT).

Following the model of the European nuclear research centre CERN, ESO goes beyond the financial abilities of individual member states to build powerful instrumentation in its field. Since the creation of ESO in 1962, its main tasks have been to build telescopes for scanning the Southern Hemisphere and to develop new instrumentation for optical astronomy.

Among telescope designers, ESO is now known as the pioneer of what are called active optics, embodied in its New Technology Telescope (NTT), which began a series of trial observations on a mountaintop in Chile in March. Active optics are the computer engineers' alternative to the cumbersome slabs of glass from which telescope mirrors have traditionally been made. Many hold that the diameter of conventional glass mirrors has now reached its technical limit, and that active optics are the only way forward.

The idea is that a microcomputer controls transducers which in turn control the precise figure of a thin glass mirror, distorted though that may be by gravity and other influences. The aim is superior resolution, but also telescopes that are more manageable and less costly. Active optics will play a pivotal role in the VLT, which is actually a set of four 8-m mirrors yielding the equivalent of a single 16-m dish. The telescope will be the largest in the world when it is completed in 1998.

The five original member states — Sweden, West Germany, Belgium, the Netherlands and France — were joined by Denmark in 1967 and Italy and Switzerland in 1982. Austria is now making a strong bid for membership. But despite an early interest, Britain has stayed out of ESO, concentrating at first on collaborations at observatories in South Africa and Australia and, more recently, on telescopes of which it is the chief owner in the Canary Islands and Hawaii.

ESO has its European headquarters in a smart modern building in the Bavarian flatlands at Garching, near the Max Planck Institute (MPI) for Physics and Astrophysics, the MPI for Plasma Physics and the campus of the Technical University of Munich. It operates or shares the 15 telescopes (counting the NTT) at La Silla in northern Chile, 600 km north of Santiago. The staff of 280 is divided

between Garching and La Silla, where most of the technical staff is Chilean. In Garching, there are about 50 astronomers (10 permanent) and 80 other staff members. The remote site at La Silla — Spanish for "the saddle" — in the Atacama Desert is "one of the most unpolluted sites on Earth in every sense", says Richard West, an ESO astronomer. The first telescope went into operation in 1968.

The organization of ESO is virtually identical to that of CERN (see page 722). An administrative council meets twice a year to decide budget and policy issues. A director-general (now Harry van der Laan of the Netherlands) is responsible for day-to-day operations. The scale is the most important difference: ESO is about ten times smaller than CERN. The annual budget of about DM50 million (it will rise to DM100 million in the 1990s because of the VLT) is shared by member states, with the larger states paying more.

ESO has generated excitement among European and outside astronomers with its ambitious plans for the VLT. Expatriate Europeans such as Jacques Beckers of the Netherlands, recently of the US National Optical Astronomy Observatory, have been lured back from the United States to work on the VLT, whose construction was approved unanimously by ESO member states in 1987. The VLT construction budget is DM382.2 million.

VLT is the logical offspring of NTT. The active optics of NTT are expected to allow the 3.58-m telescope a threefold improvement in resolution over that of previous instruments. Active optics will be a necessity for the VLT, whose 8-m mirrors would collapse under their own weight if ground at conventional thick-

The New Technology Telescope and results of 'first light' on 23 March. Inset shows an area near Omega Centauri, with 'seeing' low at 0.39 arcsec.

ness. ESO researchers expect to choose a site in Chile for the VLT by 1990. The first telescope may be working as early as 1995.

One of ESO's obvious difficulties is its popularity. As at other well-equipped observatories, only about a half of the 700-750 applications for observing time can be granted each year, and many successful applicants receive less time than they ask for. A committee made up of astronomers from each member state rates the proposals numerically, but the director-general has the final say. Van der Laan's task is "tricky and difficult", says West, especially because not all heavenly objects can be observed all the time.

Although ESO is a European organization, astronomers from member states enjoy no advantage in the refereeing process. Chilean, US and British groups have all been granted time in recent years. West says that the competition for time has raised the quality of European proposals — and, in the end, Europeans do receive most of the observing time.

What advantages accrue to ESO's member states? The most obvious is the organization's reason for existence — that astronomers have access to telescopes of a quality that national organizations would be unable or unwilling to finance. There are other tangible benefits, not least access to technical knowhow. Thus ESO was early in the field with the use of image-processing systems for extracting information from images of the heavens. Astronomers who used to travel to Garching to use its image-processing systems have often been able to find the funds with which to build their own, but ESO continues to provide software support to member states and others free of charge.

Italy and Denmark have decided to build versions of ESO instruments for their national astronomy programmes. Indeed, Italy joined ESO in part to gain the technology to build its own 4-m telescope. The project has a name — Galileo — but not yet a site.

ESO's small staff of professional astronomers, deliberately kept small, is regarded as a collective benefit. To keep ideas flowing in, there are only a few permanent positions. In striking a balance between a self-standing research organization and a service organization for its members, ESO (prodded by its council) has leant in the second direction.

ESO wins praise from astronomers not only for providing a unique opportunity for them to observe the southern sky. La Silla and Garching are also well known as meeting places where collaborations are incubated. VLT may be such a powerful magnet for observers everywhere in Europe that its influence could extend far beyond mere time-sharing. After all, as Beckers says, VLT "is where [optical] astronomy is going." **Steven Dickman**

## Fight for tape recorders

### Dwingeloo (Netherlands)

IMPROBABLY hidden in the pine-woods south of this hamlet near Groenningen is a radiotelescope and a smattering of low-built offices. The site is that of a European collaboration of radioastronomers who may yet be able to build a gigantic tape-recorder allowing a score of observatories elsewhere in Europe to pool their signals in the astronomers' common cause of seeing further. But the cause has been cruelly frustrated.

Dwingeloo is also the headquarters of the European Consortium for VLBI (for Very-Long-Baseline Interferometry). The technique of correlating accurately timed signals from several radiotelescopes, all pointing in the same direction, makes the accuracy of the position of a simultaneously observed radio source greater than the sum (in any sense) of the accuracy of the separate observations. The headquarters of the Netherlands Foundation for Radio Astronomy (NFRA) is also sited at Dwingeloo.

The European Consortium is, just now, at its wits' end because of uncertainty over its plans for the future. Last year, it applied to the Stimulation programme of the EEC for funds to finance its technical development. But the EEC Commission said "No".

In reality, the VLBI Consortium is a club. The founder members are the observatories at Bologna, Effelsburg (near Bonn), Dwingeloo, Jodrell Bank and Onsala (Sweden), and associate members include the Paris Observatory (Meudon) and institutes in Moscow and Poland. The six regular collaborators have committed between a quarter and a third of their observing time to VLBI. Projects are put forward by astronomers individually, and assessed by a programme committee. Richard Schilizzi, project manager for NFRA at Dwingeloo, says that the consortium is two to three times oversubscribed on a 24 hours a day basis. Moreover, the network is growing rapidly.

Like all VLBI collaborations, the club's collective ambition is so to improve on the accuracy with which measurements of the position of distant radio sources are made that the large-scale yardstick of the structure of the Universe will be better known, nearby galactic and even stellar phenomena will be better understood and the year-by-year movement of the Earth's tectonic plates will be more accurately measured.

The European Consortium is anxious not to be left behind by its competitors, the chief of which is that in the United States. Europeans are envious of the US VLBA (Very-Long-Baseline Array) project, which is now building ten 25-m dedicated radiotelescopes operating in

nine frequency bands between 1 metre and a few millimetres.

From the outset, VLBI techniques have been especially valuable in mapping the structure of distant quasars and other active galaxies; Schilizzi says the recent observation by VLBI of extragalactic water and hydroxyl masers offers a chance of constructing an independent and objective distance scale for the Universe.

So, with all that promise, why are people so glum? The difficulty is that the analysis of VLBI data is becoming steadily more complex — and expensive. Collaboration requires that each observatory should have a decent clock and a more than decent tape-recorder.

With the development of millimetre-wavelength telescopes (which improves the resolution of the system), recorders must be capable of storing huge amounts of data — 512 megabits a second is the new standard, which is roughly the information content of 100 standard video signals. But then it is necessary centrally to correlate up to 20 of these recorded signals electronically, which means synchronizing and then multiplying together each pair of signals from the contributing observatories.

The 18 million ECU for which the European Consortium applied last year would have been spent on the development of the tape-recorders and the correlator followed by their installation at Dwingeloo. The consortium points out that the only correlator in Europe at present capable of dealing with millimetre-wavelength signals is that at Effelsburg, which can handle signals from only three independent telescopes and which is, in any case, fully extended.

Schilizzi says that it is essential that the project should cover the cost of providing each of 11 telescopes with a tape-recorder (and a spare). Otherwise, he says, national grant-making agencies would skimp on the cost, and the resulting non-standard equipment would yield signals that could not easily be compared.

There is a Euro-industry argument on the consortium's side: broad-band recording techniques and equipment will be in great demand as high-definition television gets under way. So why not put some millions of ECUs into the development of such machines, equip a score of observatories with them more cheaply than they could be bought and leave some European manufacturer with an expertise now lacking?

It seems generally agreed, even in Brussels, that the argument is appealing. People have plainly listened to it attentively — and have then decided that there is nothing they can do. But the last has not been heard of Dwingeloo's ambitions. □

## Monastic calm and money worries

### Paris

JUST a 20-minute train journey from the centre of Paris in 11 hectares of parkland lies what has been described by its director, Marcel Berger, as "a monastery and a beehive" — the internationally renowned Institut des Hautes Etudes Scientifiques (IHES). The paradoxical metaphor is justified.

On the one hand, the institute provides the isolated calm necessary for profound meditation on theoretical problems, while the six permanent fellows last year attracted 872 researchers from 42 countries to exchange ideas in the vanguard of mathematics and theoretical physics.

Inspired by the Institute for Advanced Study at Princeton, IHES was set up in 1958 by Léon Motchane, Jean Dieudonné and Robert Oppenheimer as a European centre of excellence in mathematics and theoretical physics. The Second World War had seen some of Europe's most able scientists seek refuge in the United States; naturally, there were fears that the centre of gravity of science would move irretrievably across the Atlantic. In poetic justice, IHES stands on the site of a chateau commandeered by the Nazis during the occupation.

Very much like its Princeton model, IHES has a small number of permanent fellows on comfortable stipends for life — although mathematician René Thom is the first to continue to retirement so far, becoming an honorary fellow this year.

Fellows are free from all teaching and administrative obligations and do not have to account for their time, apart from an undertaking to spend 6 months of the year at the institute. In practice, they have catalysed revolutions in their specialisms. During the 1960s and 1970s, for example, the institute established itself as the world's temple of algebraic geometry, through Alexandre Grothendieck, Jean Dieudonné and Pierre Deligne.

Although fellows leave an indelible mark on the choice of themes, these have evolved over the years, aided by the presence of a handful of invited long-term visitors who stay for around five years, and a long line of visitors spending up to a year at the institute.

Today, the permanent fellows are Jean Bourgain, Mikhael Gromov, Louis Michel, David Ruelle and Dennis Sullivan. This year, theoretical physicist Thibault Damour fills a vacancy left by Oscar Lanford, opening a new avenue of research in general relativity and cosmology.

The institute's private status is anomalous, for 64 per cent of its FF19,287,000

## SYNCHROTRON RADIATION

## Grenoble as physics city

## Paris

THE French city of Grenoble, near the Swiss and Italian borders, is, by a mixture of fate and design, becoming a 'Eurocity'. But unlike Brussels, Strasbourg or Luxembourg, Grenoble's cosmopolitanism stems not from politics but from a distinctive blend of unrivalled basic science facilities and new technology industry. The city's fourteenth-century university may already have had an international flavour, but twentieth-century physics has put Grenoble on the map of European science.

In 1946, the French national science research centre (CNRS) opened its first major laboratory outside Paris in the city, with its Service National des Champs Intenses. In 1956, the French atomic energy commission (CEA) chose Grenoble for its research establishment and in 1966 the Institut Laue-Langevin, which houses the world's highest-performance neutron-beam reactor, joined the family.

This year, construction has started on the latest, and most European, of Grenoble's big science instruments — the European Synchrotron Radiation Facility (ESRF). The idea that Europe should build its own major synchrotron facility was first put to the European Science Foundation in 1975. There followed a period of diplomacy, definition and costing until, in 1985, the two major promoters, France and West Germany, proposed to go ahead with the project.

At the end of 1985, a memorandum of understanding was drawn up between France, Germany, Great Britain, Italy and Spain. In 1987 the protocol was signed, with Switzerland and a Nordic consortium joining the original five members. The formal convention and statutes allowing money to be spent was signed in Paris on 16 December last year.

At present, the site is being excavated, but, says Karl Witte, assistant to ESRF's director (Ruprecht Haensel), "you can already see a few circles on the ground". The first seven of ESRF's beam lines are due to be opened in 1994, with a target date of 1998 for the full 30 planned. When completed, ESRF will be the world's most powerful radiation synchrotron, able to accelerate electrons or positrons up to 6 GeV, with a beam width of about one tenth of a millimetre.

But the title may quickly be lost. A 7 GeV synchrotron is to be built at the Argonne National Laboratory in Illinois and, last December, the Japanese government announced plans for a 8 GeV synchrotron facility near Osaka.

The total cost of ESRF will be FF2,600 million (about \$406 million), with operating costs for 1994–98 estimated at FF1,000 million. France is contributing 34 per cent of the cost, and in addition has

supplied the site and the local infrastructure. West Germany is the second largest partner, with a 24 per cent stake, followed by Italy (14.5 per cent) and Britain (12.5 per cent). The balance will be shared between Spain, Switzerland and the Nordic countries (4 per cent each) with Belgium providing 3 per cent.

Last month, at the first ESRF users' meeting, 200 Europeans and a handful of colleagues from the United States, Japan and Israel, discussed priorities for the first seven beam lines and verified that the synchrotron's specification (called the 'red book') is still appropriate. Discussions will continue until the scientific advisory committee meeting at the end of June.

Although ESRF still has only a skeleton staff, there are already signs that it may be difficult to achieve a mix of nationalities in the resident staff (on five-year fixed con-

A model institute, but building is under way.

tracts) which reflects members' relative contributions. "We wanted to keep the French presence below 50 per cent", says Witte, but the proportion seems now to be about 52 per cent. The difficulty is that it is not easy to attract scientists and technicians from other member states because ESRF can offer only French salaries in line with those of the CEA. Constitutionally, ESRF is a French company and in that respect unlike, for example, CERN, where salaries are fixed on the international European scale.

More than 2,000 people are expected to use ESRF each year, with all costs paid for out of member states' contributions. Experiments will be selected on the basis of merit by a scientific panel on which each member state will be represented. If a "significant imbalance" emerges between a country's rate of use of the facility and its percentage contribution, the statutes provide for an eventual retrospective "readjustment" of payments. This principle may free referees assessing proposals for using the machine from the straitjacket of national time-sharing quotas.

P.C.

(\$3.2 million) budget comes from the French Ministry of Education — an initiative started by President Georges Pompidou in 1965. Before that, IHES scraped along with relatively small subscriptions from a handful of business sponsors. But this year, only FF570,000 (\$95,000) has been contributed by the private sector. Now, laments Marcel Berger, it is almost impossible to find money for basic research in industry. This has always depended on personal contacts established by the incumbent president, and can lapse when there is a change at the top.

Although genuinely international, IHES derives only 15 per cent of its income from European governments and is not eligible for European Commission support. Since 1971, the British Science and Engineering Research Council (SERC) and the West German Max Planck Gesellschaft have each given grants, this year of just over FF1 million (\$166,000). The Swiss and Belgian governments have also supported IHES since 1971, together providing about 5 per cent of its income, while the governments of Ireland, Denmark, the Netherlands, Finland, Portugal, Israel and Brazil also make modest contributions (between \$2,000 and \$13,000). The US National Science Foundation (NSF) has supported IHES since 1985, this year giving \$65,000. This grant, a rare gesture for NSF, reflects the large number of US visitors to IHES, by far the majority.

But money is becoming an increasing worry for the institute, which started the year in deficit. "The private status of IHES gives us great flexibility and autonomy", says Marcel Berger. "The fellows' stipends, while they cannot match those available in the United States, aim to free them from money worries, while it is possible to organize a seminar or arrange a visit at the drop of a hat."

But, with the library — a former music room — cracking under the weight of its books and needing expensive underpinning, Berger is having to buy time by leaving vacancies unfilled. An important ally has been found in the European Science Foundation which, since 1976, has carried out a five-yearly review of the IHES scientific programme. The panel's review helps guarantee the institute's autonomy, while ensuring that its high standards and international connections are maintained. That, in turn, makes governments — and, in principle, industry — happier to continue their support.

Berger says it is "unthinkable" that IHES would ever be threatened with closure. But if any of its sponsors, such as SERC, should be prevented by national government policy from helping, would suffer and its sometimes fragile occupants could once again become an endangered species in Europe.

P.C.

# Europe's most influential and costly collaboration

## Geneva

CERN, the European Laboratory for Particle Physics whose new name does not match its old acronym, seems always to be celebrating something. A few years ago, it was the successful production and identification of the particles called the  $Z^0$  and the  $W^\pm$  whose existence put the cap on the unified theory of electromagnetic and weak nuclear forces due severally to Salam and Weinberg.

This year, CERN will be celebrating the commissioning of its latest accelerator, called LEP (for large electron-positron storage ring).

With just a few months to go to completion, LEP seems already assured of success. The tunnel (with a circumference of 27 km) has long since been complete and the magnets which keep the two counter-circulating beams installed. One section of the storage ring has been tested for fidelity with real electrons. The hope now is that it will be possible to put electrons and positrons into circulation soon after midsummer and that the first physics will be done early in the autumn.

The most striking feature of the way that people talk about this prospect is their confidence. The underlying assumption is that every project to build a particle accelerator that CERN touches turns out successfully. Certainly this has been the laboratory's record since the late J.B. Adams, as director, built the machine called the Super-Proton Synchrotron (SPS) and began on the task of building LEP.

The immediate objective is to collide beams of electrons and positrons circulating in opposite directions in the same vacuum chamber and each carrying 55 GeV of energy. Apart from the gigantic scale of the construction, the technical difficulties are those of shaping the counter-circulating beams of electrons and positrons and controlling the position of the particles both in space and time. The particles travel in bunches and are

meant to coincide in space and time at the eight points around the ring at which collisions are meant to take place.

With this energy, colliding pairs of electrons and positrons should yield copious numbers of the heavy bosons required by the electroweak theory, allowing the properties of these particles to be defined in detail. But there is also a scheme for making a more powerful machine of LEP by substituting superconducting cavity oscillators for those now meant to supply LEP with power. The result would be, perhaps by 1995, a machine capable of colliding 100 GeV electrons and positrons.

The scale of this project is quite breathtaking. The surface of the site shows no sign of the storage ring, which is in places

be a formal examination of continued British membership of the international high-energy physics community (carried out by a group under Sir John Kendrew), a further examination under the eye of the CERN council of the efficiency of its operations and, finally, a decision that British membership would continue, at least for the time being.

It is understandable that the workforce at Geneva (about 3,500 strong) should feel slighted by these signs of less than full approval. They are quick to point out that, as high-energy physics laboratories go, CERN is cheap, with a budget of just over 800 million Swiss francs a year out of which it must pay for the physical cost of building LEP (roughly SFr1,200 million since construction began in 1981).

In reality (see figure), CERN has been required to live within a fixed budget since the beginning of this decade. In the process, it has become expert at cannibalizing its existing machines. Electrons and positrons

100 metres or so underground despite the way the ring has been tilted from the horizontal (to minimize excavation costs). Getting to a particular experimental hall requires a journey in a vehicle through the rural lanes of (mostly) France and Switzerland, where agriculture continues undisturbed.

The hall that houses the planned experiment called Delphi is really an underground cavern 30 metres high which, last month, was buzzing with people threading power and data cables through the proper positions in the harnesses designed for them as if they were acrobats building a cocoon of cable for a mechanical monster lost underground (see this week's cover). Half-way up the detector being assembled are the ports that will deliver coincident bunches of electrons and positrons simultaneously to the centre of the detector.

That is the heroic face of CERN, which is also, by being the most costly of all international collaboration in Europe, also one of the most controversial. More accurately, that has been how it has seemed from Britain in the past few years.

In 1984, it was decided that there should

for LEP, for example, will be given their high energy by first circulating them through the oldest machine in operation at the site (a proton synchrotron) and then through the SPS (giving them a total energy of 20 GeV) before they are fed into the larger LEP ring for final acceleration and storage.

A bizarre prospect for the more distant future is that, at some stage, the same cascade of accelerators may also be used for the purpose for which they were designed (accelerating protons or anti-protons) with which to fill a companion hadron storage ring in the same LEP tunnel. Since the two booster synchrotrons also have other functions on the site, the planning of what kinds of particles are delivered to which experimental rigs in what sequence threatens to become a planners' nightmare.

The Large Hadron Collider, the scheme for equipping the LEP tunnel with a second circular vacuum chamber for storing counter-circulating protons and antiprotons, is for the time being only a possibility. For one thing, the 14 full member states have not approved the scheme (which, with its superconducting

## Science in Europe

THIS brief survey of collaborative research in Western Europe has been compiled by Steven Dickman (Munich Correspondent), Peter Coles (Paris Correspondent), Peter Newmark (Deputy Editor), whose contributions are attributed, and John Maddox (Editor).

The objective has been to illustrate by means of examples the manner in which collaborative research in Europe is undertaken rather than to provide a comprehensive survey of the institutions involved, and of their objectives. □

# Your Vision: our peptides & proteins

The ingenuity of your research program depends on your vision. But the quality of your results hinges on the purity of materials you obtain from others. When you need peptides and proteins, come to a source you can trust.

The BACHEM Group has seventeen years of experience and offers an inventory of over 5,000 products. With our internal research and development, we add an average of two new products to our inventory each day. 96% of our catalog items are immediately available, with fast delivery. We guarantee the highest purity available, with high lot to lot consistency. Our products include: □ Peptides □ Enzyme substrates and inhibitors □ Neuropeptides □ Biochemicals □ Amino acid derivatives □ Lymphokines and cytokines.

We are happy to offer custom synthesis of peptides and proteins, specialty chemicals, solution phase synthesis and molecular biosynthesis (rDNA) services, as well as custom coupling and labelling. Our production plant in Switzerland can manufacture according to GMP requirements; and both our Swiss facilities and our research and development labs in the United States make bulk quantities of most of our products available.

Let us help you fulfill your vision. Call the BACHEM Group—one trusted source for all of your peptides, proteins and related chemicals.

ESF

## Small but a powerful membership

London

THE European Science Foundation (ESF), based in Strasbourg, is the smallest but one of the most interesting of all European collaborations. It has a budget of its own amounting to less than FF14 million a year, but its influence is much greater than its budget would normally command.

The explanation is that ESF's members are neither people nor governments, but public grant-making agencies in European states. From West Germany, for example, both the Max-Planck Gesellschaft and the Deutsche Forschungsgemeinschaft (DFG) belong. All five of the British research councils as well as the Royal Society are members. Altogether, there are 50 members from 18 European countries, Finland and Turkey included.

In practice, what this means is that a project which is backed in Strasbourg is likely to win a sympathetic hearing when its advocates later take the hat around asking for substantial funds to supplement whatever seed money that ESF may have provided.

Perhaps the most striking illustration of this successful way of working is the launching of the European Synchrotron Radiation facility, now being built at Grenoble (page 721). The project first surfaced about a decade ago as a recommendation of an ESF committee consisting of accelerator physicists and potential users.

ESF knew the cost would be beyond its scope, but reckoned that it could carry out the diplomacy required to build a consortium of its grant-making members to launch the project, which has now successfully been done.

Another ESF-originated programme is the European Geotraverse, a project for the geophysical investigation of the Earth's crust along a line from Scandinavia to north Africa.

Latterly, ESF has been spending much of its budget on supporting networks of research with funds with which to organize meetings and regular visits among themselves. At the same time, it appears to have accepted that the time has come to grow. ESF's director, economist Michael Posner, is working on a "forward look" that would multiply ESF's budget by three or even five.

The foundation has also appointed a new president to take over from Professor Eugen Seibold, whose term ends in 1990. Professor Umberto Colombo, chairman of Italy's Nuclear Energy Agency, will take over in November 1990. □

magnets, would cost "1.5 LEP").

In any case, physicists would prefer to see what LEP itself produces before linking their ambitions to a particular successor. Some choices, the possibility of building opposed electron and positron colliders, for example, might make it necessary to leave the cramped site at Geneva.

On the face of things, CERN can thus see the way forward until the end of the century, which will amount to roughly half a century after its foundation (at a meeting organized by UNESCO in 1951). What, by then will it have accomplished?

Judgements of this kind are necessarily subjective. From the start, CERN has been most notably a European citadel of technical expertise, both in the construction of scientific instruments on a huge scale and in the development of fast data networks and communications interfaces for the handling of the data it produces.

While there is a sense in which CERN would be a pale shadow of its present self

CARLO RUBBIA

## New machinery on the horizon?

Geneva

CARLO Rubbia is a tall man with a stoop who became director of CERN at the beginning of the year, after helping to put the institution on the map by finding the intermediate heavy bosons (and being awarded the Nobel prize for physics in 1987). He seems to have thrown himself into his new job with high-energy diplomacy, talking to the high-energy physics communities elsewhere, notably in the United States.

Rubbia is in no doubt that CERN is technically more excellent at the craft of building particle accelerators than either the United States or the Soviet Union. He points to the high estimated cost of building the SCSC in Texas, probably in excess of \$4,500 million, and to the difficulties (now resolved) of grafting onto the Stanford Linear Accelerator a device for colliding electrons at high energy.

But Rubbia also acknowledges that accelerators cannot keep on growing as they have been, and that the time must come when accelerators are built in a wider framework than in the past. Whence the diplomacy.

The strategy is to keep CERN in the forefront of high-energy physics while arranging that member states in Europe do not have to meet all the extra cost. Rubbia claims that Geneva has the world's only permanent team of accelerator designers and builders whose success has been established by demonstration. Will not others wish to join in collaborations with them, not just for physics but for construction?

One intriguing possibility is that future members in large consortia might make contributions in kind to future projects. There is even talk that the Soviet high-energy physics laboratory at Serpukhov,

had it not been for the discovery of the  $Z^0$  and the  $W^\pm$  mesons, that slights the importance of the growing range of general physics that pours out of Geneva each year, from the precise determination of the gyromagnetic ratio to the fabrication of atoms of antimatter.

Luck has helped. At the outset, with nuclear physics riding high and not easily distinguished from high-energy physics, CERN enjoyed the enthusiastic backing of powerful figures in Britain, France, West Germany and Italy. But by being consistently more cosmopolitan than its membership (with deliberate policies of forging links with Soviet and US physics), it has won and kept a place in international high-energy physics. In the process, it has become a free-standing centre of excellence whose connections run through the whole of Europe. There are many projects on which Europe spends 800 million francs a year without anything like the benefit. □

which is already fabricating superconducting magnets for its own new proton accelerator, might carry on making magnets for the Large Hadron Collider at CERN when its own needs have been met. Rubbia will make partnerships with anybody, on any favourable terms, to see the next generation under way.

But what would happen CERN if good sense required that the next machine should be built, perhaps by a larger consor-

Rubbia stresses CERN's ability to build accelerators.

tium, elsewhere? Rubbia notes that the present machines will have life left in them at the turn of the century, and that diversifying of present interests could also provide continuity on the Geneva site. But that is Rubbia's cautious side. The chances that he will be making a fierce fight for some new machine at Geneva a few years from now. □

# One of the better models of European cooperation

## Heidelberg

LENNART Philipson, an imposing Swede, is particularly proud of 'The Operon', the new 320-seat auditorium at the European Molecular Biology Laboratory (EMBL). It symbolizes his drive, as director general of EMBL since 1982, to fulfil one of the original aims of the 15-year-old laboratory — that it should be a European centre for teaching and training in molecular biology, particularly for the benefit of the smaller countries that help pay the cost.

Training, however, was only one of the main roles foreseen for EMBL by those who argued 20 years ago for its foundation. They also claimed it would act as a meeting-place for senior European molecular biologists (as Cold Spring Harbor does for US biologists and CERN for European particle physicists), a provider of specialized facilities that would be beyond the means of most European countries (again like CERN), and a focus for molecular biology that could help to disseminate the techniques throughout Europe. Critics at the time argued that specialized facilities and large laboratories would funnel molecular biology and its practitioners into an elitist group of little influence on the development of the science in Europe.

With its training role to the foremost, EMBL now hosts annually a dozen practical training courses, most of them run by its own staff, and takes on about ten pre-doctoral students, whose quality is said to be exceptional. They take their places alongside the 120 or so postdocs who are present at any time, in a laboratory that is demonstrably European to judge by the mix of nationalities of the scientific staff.

But Philipson argues that the training functions of EMBL are much more extensive. With almost all the scientists employed on short- or medium-term contracts, there is no elitist group. Rather, youngish scientists are given an opportunity to make their scientific mark during their most productive years, before dispersing, often to their country of origin, as trained leaders with a European attitude.

The other side of that coin is less bright: with such a turnover of even its better-known scientific staff, EMBL has some difficulty in building up and sustaining a reputation as an outstanding laboratory, which is what many of its critics think it should be for its size — about 500 people, of whom half are on the laboratory staff — and cost — now about £17 million a year.

At times, this has led one or other of the countries that foot the bill for EMBL to threaten to withdraw. The biggest threat, which ran throughout 1983, came from Britain, but ended when a Medical

Research Council review of the laboratory concluded that the British contribution could not have purchased equivalent work of equal quality within Britain.

In fact, no country has withdrawn its support from EMBL, and several more have joined in recent years, although Ireland, Iceland, Portugal and Belgium remain unpersuaded. Of these, only the Belgian contribution would make a noticeable addition to EMBL's budget. If Belgium joined there would be funds to occupy the last remaining space at EMBL — a floor of the brand new wing that houses 'The Operon'.

The same wing already houses the Bio-computing Programme, which recently became the seventh research programme at EMBL and which is, in many ways, just the kind of activity in which a European laboratory should be engaged.

On the one hand, it is an attempt to build a substantial research programme in an area of science — theoretical and computational biology, particularly in relationship to proteins and nucleic acids — in which Europe needs urgently to invest. But that is why it is disconcerting that EMBL is finding serious difficulties in recruiting experienced group leaders.

On the other hand, the Biocomputing Programme includes the EMBL Data Library, which shares with its US and Japanese counterparts the unenviable tasks of feeding emerging DNA sequences (27 million bases so far) into a database and then making it accessible worldwide. The former task is being eased because sequences are increasingly being deposited directly in the library, and the latter by the advent of EMBnet, which will be able to provide access to the current library through national European computer nodes on a DecNet-based network.

Even so, the accelerating rate at which new DNA sequences are being produced means that EMBL will not for long be able to support or even house the data library. Already, the European Commission supports 40 per cent of the activity, but only for two years in the first place, and Philipson is pushing for the foundation of a separate European institute (of bio-informatics, or some such) eventually to handle the library and its functions.

Of EMBL's other research programmes, those known as Gene Expression, Differentiation and, especially, Cell Biology have established reasonable international reputations. The Biological Structures programme, while still struggling to achieve equal footing, is said to be in better shape than it has been.

Meanwhile, the Physical Instrumentation and Biochemical Instrumentation

programmes are in danger of disappearing as a matter of policy. Stemming from the original conception of EMBL as molecular biology's counterpart to CERN, the development of instruments has always been one of its missions. Pursued somewhat in a vacuum by the founding director, (now Sir) John Kendrew, instrument development has been much more closely tied to biological programmes by Philipson, who now plans to integrate them completely.

This plan, like other major policy changes at EMBL, is subject to the approval of the laboratory's governing body, the council, which comprises delegates from each contributing country and is advised by a scientific committee. As director general, Philipson is responsible for planning and execution of approved scientific programmes at EMBL, assisted by a committee of staff members.

EMBL also operates two outstations, both with an uncertain future. For that at the Institut Laue Langevin in Grenoble (see page 723) the problem is that neutrons have not turned out to be particularly useful for biologists. Grenoble, however, is the site chosen for construction of ESRF (the European Synchrotron Radiation Facility, see page 723), which will be much more useful, and where EMBL has been asked to provide a biological research support laboratory. If EMBL agrees, the days (or, rather, years) of the second outstation at DESY (the Deutsches Elektronen-Synchrotron) in Hamburg will be numbered.

Until a few months ago, Philipson had not expected these problems to be his. But after the pathetic failure of the EMBL council to find a new director (see *Nature* 337, 397 and 589; 1989), he will stay until 1995 rather than leave in a year's time.

Perhaps for that reason, and tired of being on the defensive about EMBL as well as confident that the laboratory provides much better value for money than Community programmes, Philipson is now strongly promoting the idea of founding more EMBLs, for example, one devoted to plant biology and another to neurobiology.

Peter Newmark

Top men at EMBL (Philipson, left) and EMBO (Tooze)

EMBO

## Workshops to postdocs and publishing

Heldelburg

IN contrast with EMBL, it is hard to find anything but praise for its original parent, the European Molecular Biology Organization (EMBO), which distributes fellowships, finances workshops and practical courses and now produces the *EMBO Journal*.

EMBO celebrates its silver jubilee this year. Its first grant was a small one from Israel, which to this day qualifies as a European state both for EMBO and EMBL. That was followed by a substantial grant from the Volkswagen Foundation. Finally, in 1969, an intergovernmental agreement established the European Molecular Biology Conference, the body through which EMBO's (but not EMBL's) funds are still provided. With Portugal soon to join and Belgium contributing unofficially, EMBO has a full house, and an annual budget of nearly £4 million.

The membership is drawn, somewhat unselectively, from the ranks of European molecular biologists. But the keys to its success are the select committees and reviewers, who decide which applications to support, and John Tooze, EMBO's executive secretary. Tooze also manages to edit *EMBO Journal*, act as scientific co-ordinator for EMBL and carry out research (four papers in *J. Cell Biol.* in 1987).

The greatest pressure on EMBO's budget is for long-term fellowships supporting postdoctoral fellows for 1–2 years in a country other than their own. Demand for these fellowships has increased greatly in the past five years, but plans to meet it were somewhat thwarted by British penny-saving in 1986, when EMBO's existence was guaranteed until 1995 and its budget set until 1991.

As a result, only about 30 per cent of the new applications for long-term fellowships could be financed last year, while about 40 per cent deserved support, says Tooze. Nevertheless, 142 new awards were made, together with 69 renewals of one-year awards for a second year.

Awards, Tooze emphasizes, are made strictly according to the quality of the application. There is no attempt to distribute some of the awards to each of the countries contributing to EMBO's budget — last year, 40 per cent of the new long-term EMBO fellows were working in US laboratories.

Of the original plans for EMBO, only the idea that it should award research grants remains unfulfilled. There are those who believe the time is right to start pressing for EMBO to be allowed to build on its success in that way. **P.N.**

HUBERT CURIEN

## Portrait of a European

Paris

HUBERT Curien is a European enthusiast. Perhaps more than anyone, this modest 65-year-old French physicist, who is also research minister in the Socialist French government, has accompanied European science and technology in its trajectory from a collection of national initiatives towards true collaboration.

The European Science Foundation (ESF) and the European Space Agency (ESA), along with the European Commission's EUREKA and PACE programmes, CODEST and, most recently the Academia Europaea, have each benefited from his innovative flair and enthusiasm.

Although he has been president of both ESA and ESF, Curien was first of all an

Ministère de la Recherche et de la Technologie

Curien — urbane, optimistic and idealistic.

ambassador for French science through his research on crystals and even has a new mineral, 'curienite', named after him. He has been director of the French national science research centre (CNRS) and president of the French national space research centre (CNES). He became Minister for Research and Technology in the 1984 Fabius government until the 1986 elections brought the opposition conservative party to power. In June last year, he once again became Minister for Research and Technology in the new Rocard administration.

Looking back on the past 30 years, Curien acknowledges that personal contacts between scientists inspired the creation of the first European organizations. "European countries did not know each other well in the 1960s", he says. So it was as a result of informal contacts between colleagues such as Curien, Lord Flowers and Reimar Lüst that the European Science Foundation and ESA got off the ground. "Now", he says, "we know each other better" and there is a European synergy arising from the various organizations and forums that have been established.

Historically it was through the creation of joint large scientific instruments, such as CERN, that European scientists found they could buy their own cake and eat it,

without having to be guests at the table of US colleagues. Other examples have followed, including the European Southern Observatory and the European Synchrotron Radiation Facility. But for Curien, European collaboration in science and technology means more than sharing expensive facilities. It is also a matter of bringing scientists together, not only to exchange ideas, but to influence policy.

"If thinking comes from the bottom and the money from the top, people at the bottom find themselves in a very happy situation, and as it is the people at the bottom who do the work, it is better if they are heard", Curien said in his keynote address at the foundation of the European Academy last year. And this 'bottom up' approach is the hallmark of initiatives in which he has played a central role.

EUREKA, Curien's brainchild, provides for trans-frontier technology collaboration where the projects are market-led. Similarly, CODEST, the European Commission's (EC) Committee for European Development of Science and Technology, is a platform for specialists to influence policy, while the proposed EC Assembly, due to be debated this year, will give 200 academics a voice in Brussels.

Perhaps because his own roots are still in the laboratory, Curien knows that the whole is also composed of parts which can easily find themselves isolated. It was he who first proposed the idea of 'networks' of laboratories as an alternative to the 'lame-duck' idea of European centres of excellence. Since 1974, 20 networks have been set up in specific disciplines, largely through ESF.

Now, as Europe finds its stride, Curien sees a danger that countries such as Greece and Portugal will find it difficult to keep up. "European cohesion can easily be opposed to excellence", he says. In areas at the vanguard of science and technology, he says, poorer countries may lack the facilities or trained researchers to take part. But if Europe opts for cohesion and drops these projects, the best are brought down to the level of the least good. For Curien, one way to achieve cohesion and excellence is through education.

The EuroPACE satellite teaching programme for continuing education, of which he is president, is one means to achieve equality of skills. He also wants to see more part-time posts in universities to allow researchers from poorer countries to keep a foot in good laboratories while raising standards at home.

Urbane, optimistic and idealistic, Curien continues to seek ways in which European collaboration can improve. "We cannot imagine Europe continuing as it is now. It must be more coherent." But, he adds, "with patience you can always get what you want". **P.C.**

# What kind of bureaucracy is Brussels?

## Brussels

EUROPEAN science is scattered over a score of countries: why look for it in Brussels? Because the European Commission, the executive arm of the European Economic Community (EEC), is there and has an increasingly important if controversial influence on the shape of things.

But who wants European science to be run by a bureaucracy? The question is often asked, much to the distress of the Commission's staff, whose members believe "bureaucrat" to be a pejorative term. This brief constitutional history of the EEC may put the question in a broader context although without altogether removing the slur.

The Treaty of Rome, signed in 1957, on the model of the US Constitution, defines a kind of European government with three arms — an executive (or administration) which is the Commission, a supreme court (the European Court of Justice) and a legislature (the equivalent of the US Congress). But the likeness between Brussels and Washington is only formal, chiefly because the political equivalent in Europe of the US Congress is a bastard blend of representation by member governments and by the directly elected European Parliament (which is not in Brussels at all, but at Strasbourg or Luxembourg according to the season of the year).

Much of the long-standing and broad argument about the future of the EEC turns on questions of how the Commission should be controlled politically. At the outset, the Commission was the servant of the Council of Ministers, which for practical purposes is a committee of national ministers chosen (by the governments they represent) according to the nature of the issue to be decided — agriculture ministers decide agricultural issues; prime ministers or their equivalents (plus retinues) attend the biannual meetings of the council proper, organized by whichever country has held the chairmanship of the council for the elapsing half year.

Originally, the council and its sub-councils were expected to reach decisions by consensus, which meant that each national government could veto the wishes of its fellow-members. Now, under the European Single Act of 1986 (whose most important effect is to promise the operation of a genuinely common market by the end of 1992), consensus is required only on decisions of a largely constitutional character (including the extension of EEC membership).

The sphere of influence of the European Parliament is still evolving, but is

comparable with that of the House of Lords in the British constitution. It is asked to approve the EEC budget each year (and can delay its consent), is consulted about issues bound for a decision by the council, can raise specific issues (complaints at the effect of Commission decisions on member states, for example) and can draw up and approve reports on broad policy questions (as on environmental issues) which, although not binding on the Commission, are regarded seriously in Brussels.

European federalists naturally look forward to a time when the influence of the European Parliament will have so grown that national parliaments have no more than the importance of state legislatures in the United States. Others, and governments such as the British, have a different view of the future.

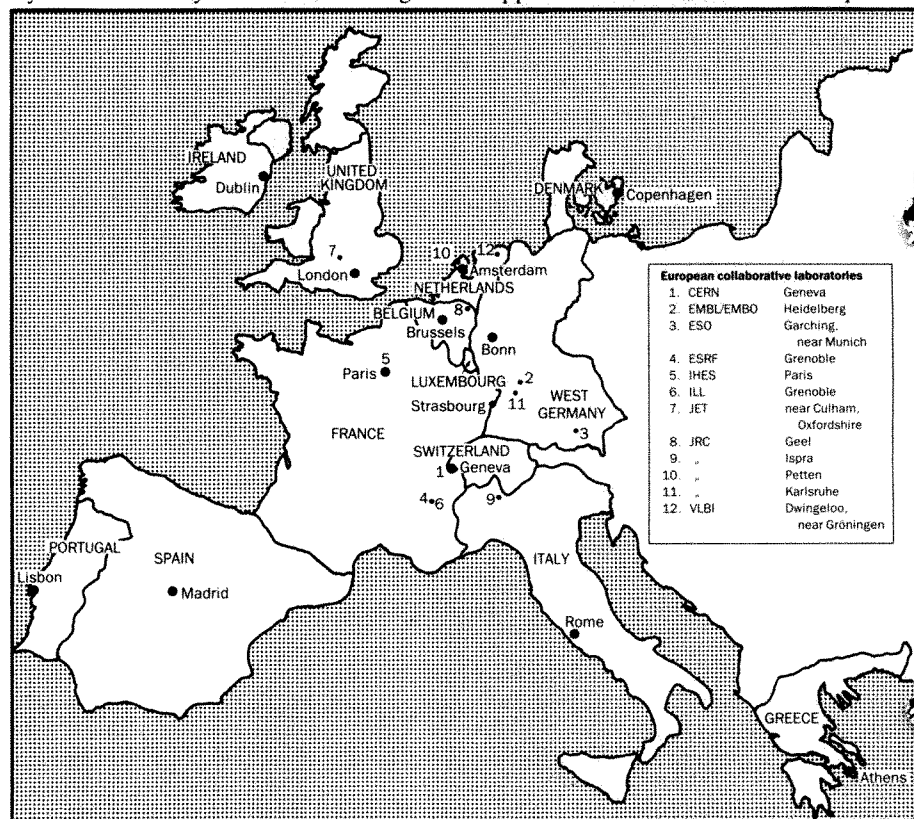

Constitutionally, it is a plain fact that the Treaty of Rome, even as amended by the European Single Act, does not compromise the sovereignty of national governments in the fields of defence, economic (as distinct from trade) policy and foreign affairs. Such forms of collaboration as there may be in these areas are voluntary. Similarly, the Commission's writ does not run to educational policy, either at school or university level, although there is a newly appointed 'task force', run by Welshman Hywel Jones, seeking to

define educational issues to be tackled.

It is also relevant, not merely to the constitutional limits of the Commission's own powers but to its own independence, that commissioners are appointed (and may be removed at the end of their five-year terms) by national governments individually. In office, commissioners function corporately as if they were the cabinet of an administration, but are also given charge of specific portfolios (areas of responsibility); each runs one of the Commission's departments, headed by a director-general, who is in turn responsible for a section of the Commission's staff (most of whom are also seconded to Brussels by member governments).

The Commission's independent powers (comparable in many ways to the now-truncated power of the US administration to make war) stem from the provisions of the Treaty of Rome requiring that member states should compete with each other on equal terms. The undoubtedly proper exercise of these powers is nevertheless one of the reasons why the Commission has won a reputation for bumbledom: its directives (on matters such as the definition of particular foodstuffs), which have the force of law in all member states, seem to arouse most derision. Much of the Commission's regulation of environmental standards derives from the same power.

It seems not to have been remarked that, in principle, the Commission's powers to require equal competition would allow it to regulate government support for research and development

# Amplify your DNA with new AmpliTaq from Perkin-Elmer Cetus.

The new AmpliTaq™ Recombinant DNA Polymerase is a superior genetically engineered enzyme offering key advantages in the patented\* GeneAmp™ Polymerase Chain Reaction (PCR) technique including:

- ☐ A purer DNA polymerase by using state-of-the-art recombinant DNA production techniques
- ☐ The elimination of unwanted thermostable nucleases since the enzyme is not purified from a thermostable bacterium

Extensive studies have shown that the thermostability and specificity of the recombinant enzyme is similar to the native enzyme and can be substi-

tuted for native *Taq* DNA Polymerase for most PCR applications and DNA sequencing.

The new AmpliTaq DNA Polymerase is also available in the GeneAmp DNA Amplification Reagent Kit which has been optimized for the DNA Thermal Cycler – an instrument specifically designed for automating the temperature cycling required in the PCR process.

AmpliTaq™ and GeneAmp™ are trademarks of the Cetus Corporation  
IsoPure™ is a trademark of the Perkin-Elmer Corporation  
\*PCR is covered by US Patent No. 4,683,202 issued to Cetus Corporation.  
Patents pending on DNA Polymerase and its use.

## PERKIN ELMER CETUS

# THE NEW ANOTOP™ PLUS DISPOSABLE SYRINGE FILTER

Anotec Separations announce the latest addition to the ANOTOP range of disposable syringe filters - ANOTOP

PLUS. A new prefilter and filter in one compact unit. Ideal for the preparation of difficult samples for analysis.

## DOUBLY EFFICIENT

The NEW ANOTOP PLUS disposable syringe filter is ideal for cleaning up difficult samples which have heavy particulate loading, such as serum, food and beverage samples. The glass microfibre pre-filter (which contains no binder) retains larger extraneous matter before the sample passes through the ANOPORE™ membrane. The ANOPORE™ membrane is designed for precise filtration. Two fil-

tration stages in one simple step. Removing the need for time consuming centrifugation or expensive sequential filtration stages. Yet all this is achieved without compromising on quality. The inorganic ANOPORE membrane contained in ANOTOP PLUS is still the most precise filter available today, offering well defined retention characteristics, low hold up volume and wide solvent compatibility. ANOTOP PLUS disposable syringe filters are available in 0.2, 0.02 and 0.1µm pore sizes (the 0.1µm is designed for Mycoplasma removal). If you are regularly faced with samples containing particulates then you need a syringe filter which is doubly efficient and singularly effective. Call now for your FREE catalogue.

Transfer Membranes and Gel Blotting Papers  
for Nucleic Acid and Protein Research

Commissions in context — the structure of the European bureaucracy.

directed towards the support of its domestic industries.

So far, the Commission appears rather to have concentrated on the development of its own research policy, which is at present a corporate issue spanning at least three of the directorates-general — those responsible for research, industry and environment. Of these, that responsible for research, known as DGXII (pronounced "Dee-Gee-Twelve") plays a crucial role, both as a prime mover behind the five-year 'Framework' programme now half completed, and as the small and only source of support for basic research.

So how fair is the charge of "bureaucrat"? There is no simple answer. But the popular European view that Brussels is filled with a huge army of civil servants bent on interference is wide of the mark. The staff of 17,000 might be held to be small, given the need to administer such a variety of policies in a dozen countries speaking eight acknowledged languages.

The legalism of the Commission's procedures, especially in the drafting of its directives, is probably unavoidable given their force as trans-national legal instruments. The triviality of some of the issues dealt with (the definition of ice-cream, for example) probably reflects the influence of parochial lobbies (to which Brussels is prone), but might be avoided by clear-headed forward planning.

No doubt the directorates-general differ, but first impressions do not suggest that the senior people have a bureaucratic caste of mind. Many of them are Europeans impatient for more rapid progress towards a united Europe. Within a directorate, at least, there is also room for flexibility; DGXII, for example, is frequently able to make small grants of money to help organize meetings on issues that may lead to some collaboration. Nor do the Commission's dealings with the outside world fairly suggest that armies of

pernickety people have deliberately designed forms so complicated as to deter respondents from completing them. On the contrary, the Commission's more common failing is that too much of what it does is done with too much haste, often reflecting people's eagerness to see that money is spent as soon as the appropriate budget has been approved.

Yet there is a sense in which Brussels is a bureaucracy in the worst sense, perhaps unavoidably. The Commission as a whole does not have the flexibility, enjoyed by elected governments, to second-guess

#### IMITATIONS

### Those things that the EEC is not

London

POST-WAR interests in cooperation have littered Europe with international organizations which are often confused with the EEC. Here is a brief guide to them:

- The Council of Europe is a strictly European organization meant to foster collaboration in the fields of law and social policy (which may include, for example, the regulation of research). There are now 26 members. Its chief functions are to negotiate international conventions, which have the force of law in member states; the best-known is the Convention on Human Rights, signed in 1950, accompanied by a European Court of Human Rights which hears complaints by individuals against their governments on the recommendation of the European Commission on Human Rights. The council's headquarters are in Strasbourg.

- The Organization for Economic Cooperation and Development or OECD began life as the Organization for European Economic Cooperation. The name was changed in 1961 with the accession of the United States and Canada and, at a later stage, Japan and Australia. Outside the

their electors, shifting resources in this direction or that as circumstances change. Line-item budgetary control is implicit in everything its political masters allow it to do. Worse, the commission's own procedures are not as coherent as they should be.

For such a young organization as the Commission (or perhaps precisely for that reason), the directorates-general are surprisingly jealous of each other's powers of decision. This is the mechanism by which the Commission appears frequently to reach nonsensical and corrosive decisions on questions such as the use of hormones in growing beef cattle; the power of decision lay with those responsible for agriculture and environment, who chose not to consult those in DGXII who would certainly have known better.

The question whether Brussels might arrange to seem less bureaucratic is a question of its own department. Of necessity, the mostly intelligent and frequently idealistic people working for the Commission differ from those working for national governments in their conviction that the destiny of Europe is to be united. They naturally regard the member governments as entities that must be helped, and sometimes hectored, to share the same vision; with the passage of 30 years, their signature of the Treaty of Rome seems to count for little in Brussels now. Could that be why there seems always to be at least one, and sometimes several, among the member governments which is or are uneasy with the process they began? □

field of economics, OECD has a section of science and technology best-known for its collections of statistics on scientific manpower and spending and for its occasional reviews of national science policies. OECD also operates the Nuclear Energy Agency and the International Energy Agency. The organization is based in Paris.

- The Western European Union is a treaty between seven governments, including Canada and the United States, which among other things is the forum in which the West German government has undertaken never to make nuclear weapons and in which Britain and the United States have undertaken to maintain armed forces in mainland Europe. The headquarters are in London.

- EUREKA is the organization set up on a French initiative in 1985 to arrange for European collaboration on the development of marketable products. Originally advocated as a mechanism for stimulating European industry because, at the time, it was suspected that US industry would be stimulated by the Strategic Defense Initiative (SDI), Eureka now has an administration based in Brussels □

# Budget an endless bone of contention

## Brussels

By the standards of many governments which are members of the EEC, the Commission has a substantial budget for research. In the five-year period ending with 1991, the Commission will have been spending roughly 1,500 million ECU a year, but the research people at Brussels are now excited by the prospect that their collective budget will be increased to 2,500 million ECU a year from about now.

Even at the present level of spending, the Commission's research budget is, in round numbers, virtually on a par with what Britain calls its Science Budget, spent through the research councils on university and in-house basic research. It is also roughly equivalent to the combined federal subventions in West Germany of the Max-Planck Gesellschaft and the Deutsche Forschungsgemeinschaft. But officials here insist that their budget is roughly 4 per cent only of total European spending on research.

The prospect that there will now be an increase seems to be a little-noticed consequence of the budget agreement in the closing days of 1988 at which member governments agreed that there should be a further squeeze on the cost of supporting European agriculture. As yet, there are no firm plans for spending the extra money. (There are a few suggestions elsewhere in this section of *Nature*.)

This is a far cry from the second half of 1986, when it seemed as if the British government would carry its opposition even to a reduced programme to extreme lengths. Earlier that year, the British and West German governments had objected both to the scale and the character of what the Commission calls its "framework" programme. Even after the West German position had been modified, the British government persisted with its opposition, acquiescing only after 1988 had begun.

Curiously, direct authority for the Commission's research programme derives only from the Single Act signed in February 1986, which leaves the Commission in no doubt of its responsibilities. The chief task is to strengthen European industry and to help make it more competitive. Roughly 42 per cent of spending in the current programme is under the heading of "Towards a large market", most of it in telecommunications, but 100 million ECU is set aside for traffic and travel projects. Energy (22 per cent), industrial modernization (16 per cent) and applied biology (5 per cent) consume a little more than that (see figure).

The general way of working in the industrial field is that the Commission offers research and development grants on a

50:50 matching basis to consortia of industrial companies or other organizations (such as universities and national government laboratories). A precondition of an award is that the partners must be drawn from at least two European countries. The best-known of these programmes is the telecommunications programme, ESPRIT, on which 2,350 million ECU will have been spent between 1986 and the closing months of 1992.

But the Commission also has research projects which are more particularly its own, outstanding among which is the controlled (and high-temperature) thermonuclear fusion programme whose chief embodiment is the JET (for Joint European Torus) thermonuclear tokamak device in Oxfordshire, England. This pro-

The Commission's current research spending programme will have cost the EEC more than 1,200 million ECU over six years by the time the present phase comes to an end in 1991. (The Commission meets 80 per cent of the total cost.) The design of the next machine, called NET (for Next European Torus) is under way but a decision on its construction (and even siting) has yet to be made. The Commission also contributes to the cost of some national thermonuclear programmes as at Garching (West Germany) and Frascati (Italy).

More contentiously under the Commission's own control are the laboratories grouped together under the name Joint Research Centre (see page 732), mostly inherited from the Euratom organization (which, like the European Iron and Steel Community, was one of the precursors of the EEC). There are four laboratories in Belgium (Geel), Italy (Ispra), the Netherlands (Petten) and West Germany (Karlsruhe), but the work is organized into nine divisions (called institutes), dealing with topics as different as transuranic elements (Karlsruhe), materials (Petten) and environmental safety (Ispra).

The centre's budget problems have their roots in EEC history. Euratom was conceived of as a research organization, but later acquired responsibility for the operation within Europe of safeguards on the use of fissile materials. When Eur-

atom's member states were full of enthusiasm for nuclear energy, it seemed natural that the organization should be ready to build prototype reactors of all kinds, for which purpose research stations were plainly needed. But then the gilt disappeared from that gingerbread.

Ispra, the largest site, has been consistently the most troublesome. Now, after successive painful reorganizations, the laboratory is on the way to being a kind of European Standards Laboratory with responsibilities, on the side, for nuclear reactor safety and environmental safety issues. But the Commission's continued support of the Joint Research Centre was one of the causes of trouble in 1986.

By the standards of these expenditures basic research comes a poor last (page 734). Spending on the relevant part, what is called the EEC's stimulation programme has been fixed at 167 million ECU over the five years to the end of 1992 (up from a total of 60 million ECU in the previous three-year period). Transnational collaboration is a precondition for a successful application, but matching funds are not required.

On the face of things in Brussels, there is general contentment with this pattern of spending. The common goal is to create the single market and somehow to arrange that it is competitive with the rest of the world. If there is a research programme, and especially a substantial one, is it not self-evident that it should be pointed in the same direction?

To outsiders, that logic may not be nearly as compelling. If, for example, the objective of the creation of the single market is that competition between companies should be free and efficient, without reference to their geographical location, will it continue to make sense that most forms of EEC research support should be devised so as to marry efficient companies with less efficient collaborators? And if the Community is concerned about its supply of skilled manpower, might there not be something to be said for strengthening the infrastructure?

Asking such questions in Brussels does not physically endanger one's person; indeed, people are very polite and are willing to acknowledge that they are questions that should be asked. But of whom? The Commission has problems enough on its mind, the European Parliament is preoccupied with the environment and bothered by the discomforts the single market will bring to its constituents. The main council (which meets only twice a year) will have horrendous political disagreements, such as that over monetary union, to resolve by 1992, while the sub-council on research could hardly settle on a change of direction without approval from above. Yet it will be a pity for Europe's dreams to go unanswered because nobody has the time to listen to them. □

## INDUSTRIAL RESEARCH

# Sponsored research but with strings attached

## Brussels

FOR the time being, the cornerstone of the Commission's effort in research is the conviction that European industry must be helped to be more competitive with the outside world, and that the sponsorship of industrial research is the best way of doing that. How well is it doing?

The best-known and the first major collaborative programme is that known as ESPRIT, intended when launched in 1984 as a ten-year programme of research and development in information technology, financed on a cost-sharing basis between the Commission and collaborating companies. (The Commission's share is more than 300 million ECU a year.)

ESPRIT inevitably became the model for later programmes. One of these, BRITE, is a cost-sharing programme aimed at improving the production technology and thus the competitiveness of small and medium-sized enterprises, SMEs in Eurospeak, on which the Commission has spent 175 million ECU on 230 projects since 1985.

The diversity of these programmes is widely remarked upon, as is the enthusiasm of those who take part. ESPRIT, for example, covers everything from the design of the semiconductor elements of computers to the development of software and hardware for desk-top publishing.

Out of the first of these interests has grown the programme called JESSI on the development of submicron computer chips (see *Nature* 337, 682; 23 February 1989). Garcia Aroyo, the DGXII director with responsibility for technological research, appears sanguine at the prospect that his colleagues will soon be labouring under 800-900 applications for funds to support industrial research in production technology and materials development. BRITE was merged with a parallel programme on materials development from the beginning of this year; the closing date for applications under the combined programme (on which the Commission will spend 500 million ECU in the next four years) is 12 May.

The rules are the same. Successful applications must involve industrial companies from more than one European country (and not more than two-thirds of the total grant can finish up in any one country). Companies must be genuinely independent of each other (which means that the collaboration cannot simply be a means by which one company and its subsidiaries elsewhere collaborate on work they might have done anyway). A small proportion of the funds (up to 7 per cent) may be spent on proposals by university consortia for generic investigations provi-

ded that the proposals are endorsed by industrial companies.

Projects must be original and preferably applicable in more than one industry. Interestingly, companies from countries in the European Free Trade Area (Norway, Sweden, Finland, Austria and Switzerland) may take part, but cannot receive Commission funds (and may have to contribute modestly to administrative costs). Research projects must be "pre-competitive". This time round, there is also a scheme for providing up to 75 per cent of the cost of a feasibility study (up to a maximum of 25,000 ECU).

This year's programme has plainly been much influenced by the report of an influential evaluation panel under Yves Farge, vice-president for research and development at the French company Pechiney et Cie., which reported last July. That panel, for example, recommended the merging of the BRITE and advanced materials (EURAM) programmes.

The Commission has also, in a late amendment of its proposals, followed the recommendation that universities collaborating in industrial projects should be recompensed by the Commission for the full cost of their work. (Under the old arrangements, industrial partners would usually pay the other half of the cost.)

Of the questions raised by the Farge committee, those implicitly answered so far are procedural in character. More fundamental issues are unresolved, conspicuously the panel's concern at what it called a "major contradiction" in the Commission's restriction of the programmes it would support to those judged "pre-competitive".

The principle is that the Commission will not support industrial development work leading directly to marketable products or usable processes, but only industrial research of a generic character on which more pointed research programmes can be based. The experience of the BRITE programme apparently showed that some "excellent projects" were not supported because they were judged to be "too competitive", but that the fear of falling into that trap pushed other applicants "upstream", with the consequence that the industrial interest of their projects was diminished. This complaint is also a dilemma for the Commission. Relaxing the pre-competitive rule would place the Commission in the position of providing direct support for commercial development by individual companies.

But the Farge panel points to the recent amendment of anti-trust legislation in the United States allowing research and development partnerships, and says that

## SELF-EVALUATION

## Rooting for grants

SELF-EVALUATION is the price the Commission has to pay for its existence. Councils of ministers insist upon it. But one official describes the process as the administrative equivalent of repeatedly digging up a newly planted tree to see whether its roots are growing.

The Farge panel, for example, was in a position to attempt to estimate the economic benefits that would flow from the two first phases of the BRITE programme by means of a questionnaire to the industrial companies participating.

Among other things, participants were asked to estimate the degree to which the project on which they were working would increase their annual turnover, from which the Farge panel estimated that the total increase of annual production resulting from BRITE projects would exceed 2,000 million ECU. But the panel also noted that the same companies planned to commit only "modest" sums to the further development of the outcomes of their projects, for which reason it suggests that the economic benefits expected of the projects should "be viewed with some caution". □

"the law should be the servant of the Community, not its master". The panel also complains that the Commission, in its management of its research programmes, has not been sufficiently explicit about its objectives.

More generally, the panel pointed out that it had not been able to put the BRITE programme "into perspective in a coherent approach to an industrial research and development policy". This criticism appears only partly to have been met in the new phase of the programme.

BRITE covered nine disparate fields such as computer-aided design (CAD) and production technology for flexible materials (mostly textiles). Its successor has only five broad headings, which may be thought a step towards the definition of a strategy. Three are aeronautics, advanced materials and design, quality and reliability. There are also subprogrammes for the application of known manufacturing technology and the development of novel techniques and processes.

The Farge panel was also concerned that the Commission's own judgement of which projects to support is excessively technical, and insufficiently informed by business considerations. (The Commission's technical staff do get high marks for competence and enthusiasm.) The consequence, the panel said last July, is that there was too much "technology push" and not enough "market pull" in the BRITE programme.

In the nature of things at Brussels, it is too soon to know how the next evaluation panel will rate the achievements of the new programme. Much will depend on how the Commission's officials adapt their choices to the Farge's panel's pleas. The test will be whether Europe's middle-sized businesses are markedly more efficient. □

# Linking an optical cable to every house

## Brussels

WHO knew that Europe is building the hardware and software for a broad-band communications network that will begin to be a reality six years or less from now? The goal is to develop, by 1995, the technical ingredients required for a digital communications network capable of distributing through optical cables both high-definition video signals and huge quantities of data. Brussels seems confident that the project will succeed.

In many ways, the RACE project is what Pierre Aigrain, the French government's chief adviser on science and technology in the late 1960s, was then pleading for (to the EEC). But the new project's ambitions go far beyond Aigrain's hopes. One of the objectives, for example, is that all European dwellings, not simply business offices, should eventually be connected to the network. Meanwhile, there will be high-definition television for all, and pan-European mobile cellular telephony.

According to Roland Hüber, the director in charge of what is called Directorate F (a branch of DGXIII, the Commission's telecommunications ministry), RACE has now let 85 contracts to groups of companies and other organizations (on the Commission's usual 50:50 basis). More than 230 companies are involved, including all the major manufacturers of telecommunications equipment in Europe (together with AT&T and IBM). There are also 89 universities and other independent research organizations, as well as 11 PTTs. Collaborators from the European Free Trade Area are welcome.

As a means of organizing a major tech-

nical project, RACE is itself an innovation (which has been replicated in many of the Commission's projects). The pattern is determined by the circumstance that the Commission is merely the stimulator of innovation, not its eventual executor. Even so, the first step seems to have been to define objectives and to carry out a critical-path analysis for their attainment. But the objectives are not merely technical — the programme supposes RACE must also demonstrate useful applications of broadband networks, which means stimulating demand, and must then study some of the almost sociological problems that are bound to arise so as to demonstrate to eventual investors in the network that their money will be returned.

A further difficulty is that the Commission's funds cannot possibly be stretched to cover all the developments that will be needed for such a project, whence the decision that the Commission should advertise all the tasks that will have to be carried out, but to let contracts for the critical nodes and for a proportion of the others, leaving it to the competitive instincts of the disappointed applicants to pursue projects with their own resources.

The earlier phases of RACE (which began formally at the beginning of 1988) are largely technical, ranging from software development to the investigation of indium phosphide as an alternative to barium niobate in optical switching. Now, while the first crop of projects is under way, the Commission is looking for demonstrations of applications.

Even these phases of the programme offer everybody something. One of the

pilot application projects approved this year, for example, involves 15 European museums (the majority in West Germany) which have undertaken to develop means of displaying museum objects on workstation screens, together with associated sounds and images, so as to make museum collections generally available. The project requires the development of techniques for managing archives by means of expert systems. RACE is interested because similar techniques could be applicable in business. There are also two publishing projects — one involving the rapid transmission and processing of information that may be provided in different forms, the other more specifically concerned with the transmission and local production of newspapers.

A large part of the explanation for change of climate is that the Commission can now boast of having won the collaboration of Europe's traditionally quarrelsome PTTs. One theme running through the report of a strategic audit of the project carried out by a team in which PTT managers were prominent is that national governments must quickly make up their minds about the regulatory framework within which the communications network will operate.

RACE is one of the EEC's more obscure acronyms (standing for R&D in Advanced Communications for Europe), but the word epitomizes the sense of urgency in its conception. The project owes its existence to the recognition in 1985 that the development of broad-band communications systems in Japan and the United States was ahead of that in Europe, and to a calculation that European companies and PTTs, left to their own devices, would not be able to bridge the gap.

By 1986, the Commission was asking for 800 million ECU to support its work-plan, but the request was trimmed to 550 million ECU in the framework budget eventually agreed. Now the Commission is asking that some of the funds should be restored, as it has emerged that many of the projects it has backed will need five, not three, years to complete.

The management of the programme sets great store by the biannual meetings at which all the project teams are represented. Otherwise, projects are autonomous and, as with other industrial research supported by the Commission, members of the project teams make their own arrangements for sharing patent rights and, in due course, such profits as may flow from their development. But the Commission has the right to require that patent rights should be licensed on reasonable terms to other European companies. Beginning in 1992, it is intended that there should be demonstrations of the kinds of integrated networks that may be built from the components that will by then have been developed, at

## APPLIED BIOLOGY

# Travelling a slow road to new technology

## Brussels

THE Commission's research strategy gives applied biology a central place, but progress has been slower than people in Brussels were hoping as long ago as 1980, when the Commission began modestly to support biotechnology projects. Not that enthusiasm has dimmed, but regulatory hesitations by some member states are one cause of delay. Another is that the European blend of well-established pharmaceutical and chemical companies and small start-up companies does not easily lend itself to the kind of financing with which the Commission is most familiar.

The Commission nevertheless maintains a kind of cheerleading organization called the Concertation Unit for Biotechnology in Europe (or CUBE) which is a fertile source of ideas and, occasionally, of smallish pro-

grammes backed by Commission funds. One of its tasks is to steer Europe towards applications of biology that will not further increase present embarrassing overproduction of many kinds of foodstuffs, whence the strategy of encouraging the development of new kinds of crops having a greater nutritional value or containing important industrial raw materials. Using biotechnology in pest control is another goal, as is the development of techniques for using the whole of a crop plant — not just, as in the case of cereals, the seeds.

The name for the new programme, launched last year, is ECLAIR. The budget is a comparatively modest 72 million ECU over five years. But the programme side-steps contentious questions about the release into the field of genetically engineered organisms. □

# Perfection

DSM 960, the digital scanning electron microscope with integrated frame store and computer-assisted operation for automatic analysis.

The interplay of light and matter makes them shimmer in a blaze of colour: crystals, one of the many perfections of nature. Carl Zeiss also strives for perfection with its new series of electron microscopes. The optimum combination of world-renowned optics, precision mechanics and electronics for the highest possible performance.

Applications-oriented innovation and a systematic approach to design and construction – from the smallest microcomponent to the most complex assembly – result in research instruments of superb quality. These state-of-the-art microscopes from Carl Zeiss give all researchers the opportunity to achieve outstanding results, including new levels of image quality and fast, accurate elemental analyses.

Sales and service worldwide: more than 140 offices around the world to serve the electron microscopist

If your research can't wait for weeks while you wait for DNA, take a look at the Cyclone™ Plus DNA Synthesizer from MilliGen/Biosearch.

Convenient prepackaged chemistries and proven protocols allow you to produce probes, primers, even long (> 100-mer) fragments quickly and effortlessly.

Just load the reagents, key in your sequence, and press "Run." Cyclone Plus handles everything else—automatically.

In half the bench space, Cyclone Plus outperforms instruments costing twice as much.

Preprogrammed software cartridges make it easy to change protocols or synthesis scales. You can even create your own methods to customize a synthesis.

Cyclone Plus is available in either one-column or two-column configurations. And since it's priced within reach of any lab, there's no reason to wait another day. For more information, call 800-872-0071; in MA, 617-229-2870.

first on a laboratory scale, afterwards more generally.

In the end, the success of RACE will hang on the extent to which it influences the development of a broad-band communications network in Europe — and when. Much will depend on the speed and the vigour with which national governments are prepared not merely to enforce common technical standards but to create market conditions in which broad-band communications can prosper.

There are thus political as well as technical problems to solve, not the least of which is that of requiring European PTTs (most of which remain nationalized industries) to allow outside commercial organizations to lease communications channels in the broad-band network for

the provision of what are called value-added services — video signal transmission, for example.

The obvious danger is that different governments may choose to deregulate their PTTs in different ways, thus replacing the present system in which monopolies do what they wish within their territories to one in which national patterns are as different from each other as at present. The Commission spelled out the dangers in a paper published last year, but it has no power to turn its wishes into reality. RACE itself seems convinced that the pace of technical change will shorten its own timetable, but that may be an over-enthusiastic view. Political difficulties that remain unsurmounted could work the other way. □

## RESEARCH FOR INDUSTRY

# Cause and effect in a competitive world

### Brussels

THE European Commission is outspoken about its policy on industrial research, and on research in general. Starting from the calculation that the twelve EEC members spend less on research and development than the United States, both in absolute terms and relative to gross domestic product (GDP), and less than Japan by the second yardstick, the Commission concludes that the objective of its research policy must be to make Europe "competitive", pursuing "where appropriate, its own technological options".

The figures, conveniently collected in the *First Report on the State of Science and Technology in Europe* presented to the European Parliament at the beginning of this year, are chastening.

In 1985, EEC spending amounted to 76,250 million ECU, compared with 134,645 million ECU in the United States and 48,056 million in Japan. As a proportion of GDP, European spending was 1.9 per cent, compared with 2.8 per cent in the United States and 2.6 per cent in Japan. The same report notes that non-defence research and development expenditure in Japan is growing twice as quickly (9 per cent a year against 4 per cent a year) as in Europe and the United States.

The Commission is also disturbed by what seems to be a manpower imbalance. According to the US National Science Foundation, in 1986 there were 69 US workers in research and development for every 10,000 in the total labour force, compared with 63.2 per 10,000 in Japan (in 1985) and corresponding figures (in 1984) of 49.1 in West Germany, 41.2 in France and 32.8 in Britain. The report again notes that only the Japanese figure is growing quickly.

The figures for the output end of the

equation are equally sobering. The bulky annexes to the report record in detail that, in industrial sectors as different as chemical production and machine-tool manufacture, EEC performance is in relative decline.

The figure below shows the EEC's estimate of the world's data-processing

market in 1987 secured by the 20 largest companies. The report notes that sales outside Europe of even the largest of the European companies are a small proportion (15 to 20 per cent of their turnover).

The Commission's argument from this point on is simple. There is an imbalance between the EEC and Europe's principal competitors both in efforts in research and development, and in industrial performance. So is it not reasonable to link the two as cause and effect?

The conclusion is that the three goals for EEC research are to improve Europe's international competitiveness, to "increase its capacity to pursue its own scientific and technological options, where necessary by reducing its dependence on others" and "to respond to the needs of society by

improving the quality of life".

The Commission concludes that there are five areas in which European efforts should be concentrated, as follows: information technology and telecommunications, industrial materials, aeronautics "where Europe faces a particularly important competitive challenge", the biological sciences (including biotechnology) and energy.

It is clear that aeronautics will feature prominently in the Commission's next Framework programme. The argument is largely economic, but the competition is exclusively from the United States. The volume of civil air transport is growing at 7 per cent a year, and roughly 40 per cent of operating costs are determined by the cost of the aircraft, while there is also a military market in which, the Commission said in a document published in June last year, US restrictions on the sale of advanced aircraft are worrying.

The plan is that a pilot programme of coordinated research will be drawn up later this year with the intention that there should be a full-blown research programme looking for funds in 1990. For as things are, the Commission said last year, "European industry remains largely divided between national interests. . . . Continuation along this path can only lead to failure".

This important document also deals with the balance between basic and applied research, noting at one point that many European governments in recent years have effected a redistribution of resources from basic to applied research and adding "there is a risk that the pendulum will swing too far . . . just [when] our competitors are placing a greater emphasis on basic research". This is said to be a reference to the growth of the US basic research budget during the Reagan administration and to recent calls in Japan for more attention to the same cause.

On the related issue of the discrepancies within the EEC between the performances of different governments, the report notes that spending on research and development in West Germany, France and Britain (in that order) accounts for 75 per cent of all EEC spending, and that the proportion of GDP spent on research and development ranges from a maximum of 2.8 per cent in West Germany to 1.5 per cent in Italy, 0.8 per cent in Ireland and less than half of that proportion in Greece.

The discrepancy is described even more vividly in an annex to the report prepared by the Irish National Board for Science and Technology, which calculates that the GDP per head of the four poorest countries in the EEC (Ireland, Spain, Portugal and Greece) have an average GDP per head less than 70 per cent of the Community average, but spend (per head) only 25 per cent as much on research and development. □

# A new vision of unity in standards and training

## London

JEAN-PIERRE Contzen, the Belgian director-general of the Commission's Joint Research Centre (JRC), has a vision in which the nine research institutes under his wing will become an amalgam of a standard-setting organization and a means of training Europeans in new technology. Arguing that Europe has too few public research laboratories, his belief that the JRC has a future is infectious. But the future has not always been as certain.

In reality, JRC has only in the past five months emerged from the most serious threat to its existence — the plain discontent of several member states most openly expressed during the long haggle over the present Framework programme. The complaints were that the four laboratories (then distinct) were too costly, too large, badly managed and without function.

The outcome was a review process carried out by a panel under Dr Harry Becker, research director of the Royal Dutch Shell Oil Company, which began in July 1986, and whose chief recommendations were structural and managerial in character. Crucial among these was the decision that the research programme and the administration of JRC should be overseen by an independent board, whose first chairman is Sir John Kendrew, the British Nobel prizewinner.

## Commitology

BRUSSELS is as prolific in the invention of committees as in that of acronyms, and even uses the word *commitology* to describe the theory and practice of committee creation — do committee members represent member states? Who nominates them? Which arm of the EEC reimburses members for travelling expenses? Are decisions by consensus? If a decision is reached by a simple majority, can the chairman break a tie?

This year, each of the nine institutes of the Joint Research Centre (this page) will be blessed with an advisory committee. Most of the Commission's research programmes have one of their own as well.

But in the Commission's administration of science and technology, the most powerful committees are CODEST (page 734), widely respected for its independence; CREST (representing national governments and advising on general strategy), commonly said to be too big to be workable, let alone manageable; and IRDAC (which stands for "Industrial Research and Development Committee"), which suffers from the same faults. □

Contzen, previously DGXII's planner (and thus the architect of the present Framework programme), is in the unusual position of having helped to review the organization he must now administer. Plainly there is some frustration that the legal procedures were completed only in November 1988 (the new plans had to be approved not merely by the Commission and the council, but by the parliament as well). But now, with relief, he says that the new organization is in place.

The most obvious change is verbal: the Commission used to operate four Joint Research Centres, at Karlsruhe (West Germany), Geel (Belgium), Patten (the Netherlands) and Ispra (in the foothills of the Italian Alps), but now there is just the Joint Research Centre, in the singular. The three northern laboratories have been renamed as institutes (but Petten, now called the Institute for Advanced Materials, has a kind of outstation at Ispra); as yet, their research programmes are little changed.

Ispra, always the worry, has seen the most upheaval. Its research programme has been divided into five parts, each of which is renamed as a separate institute. Ispra also becomes the location of the unit intended to provide the rest of the organization with research support, principally in computing.

Part of Contzen's immediate problem is psychological: how to give the 2,180 members of his staff the ideal blend of institutional loyalty and corporate 'solidarity'? The calculation is that the identification of separate institutes dealing with different parts of the research programme is a necessary means of making the separate functions pointed and of making sure that people know what they are about. But there is also a long-term need that people should move more freely than in the past from one programme to another.

Inflexibility is the most obvious difficulty. The Community's procedures are an encumbrance: line-by-line approval and scrutiny of the budget is routine, which means that there is little scope for transferring resources from one project to another as new opportunities arise.

The immobility of the staff is another impediment. Only about 3 per cent move to posts outside JRC each year. What Contzen hopes is that the future pattern of employment may change that. New appointments are now routinely made on a five-year contract, which may be renewed for a second five-year period, but not thereafter; either the person concerned is then appointed for an indefinite period, or he or she must leave.

More than half (53 per cent) are already

employed on short-term contracts such as these. It is now also planned that there should be a system of three-year appointments that will be strictly non-renewable. The first ten posts have been advertised, but Contzen hopes there will be 150 of them in four years. He regards them not merely as a means of recruiting specialists for urgent tasks, but also as a kind of industrial postdoctoral fellowship that may be an innovation in its own right.

JRC also plans to foster its more familiar fellowship schemes (there were 11 graduate students and 24 postdoctoral fellows on the books last year) and to attract more senior people from elsewhere for periods of up to a year. (There were 58 of these sabbatical fellows in 1988.)

Contzen has undertaken that in the next four years, the annual turnover of staff at JRC will increase from 3 per cent to between 5 and 10 per cent a year. A plan to terminate the appointments of 100 staff members will help, but is bound to be a bone of contention in the council of ministers, which has been severely critical of the generosity of previous early retirement schemes.

Salaries at JRC (and at other Commission establishments, such as JET) have always been a contentious issue, partly because they must of necessity be greater than those paid in the EEC's most prosperous member states, partly because they are tax-free. The other side of that coin is that the language and cultural barriers within Europe are still so great that the education of JRC employees' children is likely to be interrupted, as will be their spouses' careers.

The quota system is another stifling influence on JRC. Broadly speaking, the nationality of the professionals on JRC's staff must reflect the size of member states. It is not so much that governments have been anxious to secure for their own nationals posts in a well-paying organization (although there is some of that); others are or have been alarmed that JRC might suck away important parts of their skilled labour force.

The Commission (which is ambivalent on the issue) offers in defence of the system the reflection that it helps to diffuse JRC's work through the Community. But quotas are an irksome impediment to good management; Contzen wishes they would go away. The question of whether there would be quotas (and on what basis) in a united Europe seems not to have been considered.

Despite the impediments, the pattern of research is likely to change more quickly now than in the past. One administrative innovation is the decision that roughly 5 per cent of JRC's resources should be spent on the exploration of new projects.

Under this rubric, in 1988 JRC embarked on investigations of the use of ultrasound (21 kHz) for removing aero-

THE nine new institutes of JRC created by last year's reorganization are as follows:

■ **Institute for Transuranium Elements**, at Karlsruhe (West Germany), may be best known for basic studies of the physical and chemical properties of the actinides, but is also the originator of the project to use ultrasound for removing aerosols.

■ **Central Bureau for Nuclear Measurements**, at Geel (Belgium), has a reputation for precise measurements, most recently of the low energy fission cross-section of  $^{235}\text{U}$ , but is also making precise measurements of the silicon lattice as part of the international redefinition of Avogadro's number.

■ **Institute for Advanced Materials**, at Petten (the Netherlands), is making a transition from the exclusive study of materials under neutron irradiation (for which it was originally established) to the development of new materials and the modification of their properties by surface and other engineering.

■ **Institute for Systems Engineering**, at Ispra (Italy), develops new safeguards techniques for nuclear inspectors, gathers data relating to the safety of thermonuclear fusion reactors but is well-known for a computer program for the assessment of solar input to groups of buildings as part of a general interest in solar heating and conversion.

■ **Institute of Safety Technology**, at Ispra (Italy), is building the reaction wall for the assessment of built structure under mechanical impulsion, but is still concerned with aspects of reactor safety including the study of cooling systems in experimental rigs. It has organized a study of the problems of handling tritium in bulk as will be required in thermonuclear fusion reactors.

■ **Environment Institute**, at Ispra (Italy), traditionally concerned with air and water pollution, has now commissioned a laboratory for the analysis of foodstuffs and drugs.

■ **Institute for Remote Sensing Applications**, at Ispra (Italy), mostly working on the design of novel instruments, has recently proposed to the European Space Agency a scheme for radar sensing of the Earth's surface and plans to use Lidar for the monitoring of fluorine compounds in the atmosphere.

■ **Institute for Prospective Technological Studies**, at Ispra (Italy), is in the process of being organized as a means of contributing to the analysis and formulation of DGXII's policy.

■ **Centre for Information Technologies and Electronics**, at Ispra (Italy), is one name for JRC's computer centre, but also has responsibility for the development of software and will arrange for the design and production of specialized chips. □

sols from large masses of air (which may be useful in dealing with chemical accidents), the applications of neural networks in computing and the further development of a non-destructive monitoring instrument for assessing plutonium in radioactive wastes. High-temperature superconductivity also featured in the programme last year as, no doubt, cold fusion will in 1989.

Broader considerations point to more radical changes in the years ahead. There is, for example, an obvious difficulty at Petten, the chief site of the Institute of Advanced Materials, which also houses JRC's High Flux Reactor originally built as a materials testing tool for Euratom. The reactor is now used for the routine testing of fuel rods of different design as well as for constructional materials used in reactors, but its future is evidently linked to the uncertain future of nuclear power. Accordingly, the operating power and the duty cycle of the reactor have been degraded, if only to prolong its life.

Another strategic consideration is that JRC will be safer if it can work more directly on projects relevant to the Commission's own needs. Data-collection and dissemination (on subjects as different as world shipbuilding and the properties of potentially hazardous chemicals) is an obvious opportunity. So is work on

environmental problems, where Ispra's Institute of the Environment obviously has an advantage.

There is a programme to use satellite observation data (from the French SPOT instruments) to compile agricultural statistics, using five chosen plots of ground in different parts of Europe. Ispra is similarly working on the improvement of instruments for the non-destructive measurement of fissile materials as used by the inspectors who operate nuclear safeguards procedures. (The European Community has secured an undertaking from the International Atomic Energy Agency that its member states' compliance with the Nuclear Non-Proliferation Treaty will be assured by the reports of its own inspectors.)

In the same spirit, the research group at Ispra originally concerned with the safety of nuclear reactors, and now renamed the Institute for Safety Technology, has spread its wings also to cover the safety of civil engineering structures and of industrial plants. The group should have finished next month the design of a structure (called a reaction wall) for the measurement of seismic and other mechanical impulses to structures. It has also become a source of expertise in the application of finite-element techniques in the design of engineering structures.

But much else of JRC's work is of a general character, relevant to the Commission's needs only in the most general sense. Conversely, there are fields in which the Commission would not at present turn to JRC for advice on the solution of all its problems — the use of hormones in growing beef cattle, for example, despite Ispra's interest in NMR techniques in the analysis of foodstuffs (the alcoholic content of wine in particular; see the News and Views article on page 708 of this issue) or the development of technical standards in telecommunications (where other organizations are more expert).

Yet the new research commissioner, Filippo Maria Pandolfi, has been saying since he took office at the beginning of this year that he wants DGXII to concentrate more of its resources on 'pre-normative research', which is eurospeak for work that may help to strengthen the Commission's administrative hand, from the standardization of equipment (as in telecommunications) to the basis for environmental standards and even the promulgation of standards used in trade and commerce, the work of old-fashioned standards laboratories for example.

In a broad sense, that is also a central objective for Contzen — but nobody wants JRC to become a kind of International Bureau of Standards for Europe.

Budget pressures will also shape the future pattern of JRC. The Commission has decreed and the board has agreed that JRC should find a greater proportion of its income from outside the Commission's budget, and indeed the annual report for 1988 (issued earlier this month) says that contracts already signed will contribute about 30 per cent to JRC's costs during the four years ending in 1991. But that calculation is something of a fudge.

The external contributions (over four years) include 55 million ECU for the operation of the Petten reactor and 59 million ECU for the support of Commission activity in agriculture, the environment and the like. Genuine external contracts now signed will bring in only just under 20 million ECU by 1991, although JRC's reorganization (and the recognition that its future depends on selling its services) will no doubt increase that amount substantially. But operating costs are less than half the total: 'personnel credits' amount to 132 million ECU out of this year's total budget of 239.4 million ECU.

Indeed, Contzen is also quick to argue that these calculations do not give JRC credit for the work it does as a partner in several of the consortia contracted to work for the Commission's industrial development programme. (The rules prevent programmes such as RACE from paying money to JRC.) Institutes collaborate out of interest, but there is a possibility that royalty income will eventually accrue. □

# Larger budget still too small for comfort

## Brussels

THE Commission's programme for the support of basic research has a new budget (33 million ECU a year until the end of 1991) and also a new name — SCIENCE — which is a triumph for whichever directorate-general looks after the invention of Community acronyms. But the budget, some 3 per cent of the Framework programme, is too small for comfort — and in 1988 the SCIENCE programme made 114 grants worth a total of 36.8 million of ECU.

Not that those who administer the programme are ungrateful for last year's increase, which has virtually doubled the funds available each year, and which represents a very substantial increase over the 6 million ECU available in 1984, in the first year of what was then called the Stimulation Programme. (No less than 1.5 million ECU was then spent on a project in which half a dozen universities planned to collaborate on optical computing.)

The SCIENCE programme is the nearest thing to a grant-making research foundation that there is within the Commission's organization. Its chief objective is to encourage collaboration between basic research groups, almost always by means of grants that supplement the funds available from national sources. The same budget has been used on three recent occasions to make grants to the European Science Foundation to support networks of European researchers.

Applicants for funds should be wary. SCIENCE does not pay for expensive pieces of equipment, nor does it provide running costs while, like all grant-making organizations with small budgets, it is torn between the wish that the projects that it backs will prosper and the fear that, if they do, they will wish to turn themselves into permanent pensioners. Even so, the programme is ready with examples of projects which have gone well — sometimes, well enough to be partners in larger Commission projects under other programmes, the BRITE programme for example.

One of these is the research programme on new permanent magnets typified by the NdFeB alloys which was begun by the Stimulation Programme in 1985 and which now embraces 120 people from 58 different laboratories (most of them, interestingly, at universities). The collaboration is following up the discovery in 1963, by the Sumitomo Special Metals Company and General Motors, that sintered materials with the approximate composition  $\text{Nd}_2\text{Fe}_{14}\text{B}_7$  make permanent magnets of high field strength and coercivity.

The project has the virtue of being interdisciplinary as well as international

— there have been problems of growing single crystals, the determination of their crystal structure (which appears to be layered much as are the the high- $T_c$  superconductors), unravelling the relationship between magnetic properties and microcrystalline structure and fabrication techniques. (One remarkable development is exploitation on an industrial scale of the laboratory curiosity, called decrepitation, in which gaseous hydrogen interacts with solid  $\text{Nd}_2\text{Fe}_{14}\text{B}_7$  newly cast from the melt to reconvert it into a powder.)

The collaboration's biggest prize so far seems to have been the discovery that the partial substitution of Nd by the rare earth element dysprosium (Dy) both increases the coercivity of the alloys and the temperature (below the Curie temperature) at which the exceptional magnetic properties are retained — important because of the temperatures likely to be encountered in the electrical machines incorporating these materials. The project has now won the accolade of a Euroacronym all of its own (CEAM) and support from the programme on advanced materials.

Last year, with more money to spend, CODEST appears to have backed as diverse a range of projects as anybody could wish. The handful of mathematics

SCIENCE PARLIAMENT

## Voice for research in Brussels

### Brussels

DGXII, which unlike most of the other directorates-general at Brussels is not much molested by lobbyists, has a scheme to mend its sense of isolation from its true constituents, the research community. Almost subversively, but keeping well within the rules, it plans to establish an assembly of working scientists which will represent the research community in Brussels.

The scheme is entirely within the gift of the Commission, which is free to decide how to spend the resources set aside for meetings of people. About now, the Commission should have taken the plunge. But some member governments are uneasy, suspecting that DGXII is looking for a means of recruiting scientific advice that will be an alternative to that provided by its own placemen on the innumerable Brussels committees.

The uneasiness may be well placed. The European Assembly in Science and Technology will consist of 200 people, a third of whom will be nominated by each of CODEST (see above), the Commission's basic research committee, the European Science Foundation (ESF, see page 723)

and computer science projects, for example, includes a three-year collaboration between the universities of Aberdeen and Paris-Sud to develop software that, starting from an incomplete theory and a mass of empirical information, will seek more complete laws and define the exceptions to them.

Last year's biggest projects include a 15-laboratory collaboration to make and characterize the structure of single crystals of high- $T_c$  superconductors, which will cost the SCIENCE programme 1.36 million ECU over two years. Another project (involving laboratories in Belgium and the Netherlands with two in France) aims to build a laser capable of generating light intensities of up to  $10^{20} \text{ W cm}^{-2}$  in 30 femto-second pulses, with the objective of following the multiphoton ionization of atoms produced (2.06 million ECU over 3 years).

Nineteen laboratories (nearly half of them British) are planning to collaborate on a basic study of the properties of magnetic recording materials with the deliberate intention of providing support for European industry (1.88 million ECU over 3 years), while the Netherlands Cancer Research Institute, the Pasteur Institute in Paris and the British Medical Research Council's Radiobiology Unit at Chilton, Oxfordshire, plan to pool their expertise in the genetics of the mouse to make a start on mapping the mouse genome (1.27 million ECU over 3 years).

Last year's largest collaboration, in

and national governments (*pro rata* by some rule).

The routine function of the assembly will be that of a panel of referees to whom all kinds of questions may be referred. But DGXII seems genuinely to be looking for new ideas. No doubt there will be opportunities for groups within the assembly, form committees to advocate what seem promising courses of action. There are also plans that the members of the assembly should meet together occasionally. Dreams that the assembly may be the world's first parliament of science are not far beneath the surface.

The practical difficulty may be whether 200 people can adequately represent European science and technology. The nominations not yet made will evidently be crucial. DGXII seems anxious that its assembly should not be mistaken for the European Academy, the feasibility of whose formation is being explored by Sir Arnold Burgen, a past foreign secretary of the Royal Society of London, and with ESF itself, a consortium of national grant-making organizations which has nevertheless sometimes mistaken itself for a European academy. □

## FORWARD LOOK

## Where to go next?

## Brussels

ONE key figure in shaping the future pattern of the Commission's support of research and development is Dr Paolo Fasella, the Italian who has been director-general of DGXII for long enough to command the respect of a substantial part of European science. He is emphatically not a bureaucrat, but an enthusiast.

Last month, Fasella was basking in the outcome of the council meeting on 14 March. The decisions taken then bring to 98 per cent the proportion of the current Framework programme budget which has been approved (but some projects still have to work their way through the parliament). There is now a sense of expectation as people ask themselves what will follow. Will the expected increase of the budget from 1,500 million to 2,500 million ECU by the end of 1991 materialize?

The same meeting of the research council approved one of Fasella's favourite projects — that of using Community funds (30 million ECU by the end of 1991) to make better use of major installations scattered through the Community. The starting-point is the calculation that pieces of equipment as different as radiotelescopes and synchrotron light sources may be under-used because those for whom they were built do not, or no longer, use them fully. A synchrotron, for example, may have been equipped with fewer outlets on its circumference than can be accommodated.

Under the new scheme, operators of large EEC installations may be given grants with which to upgrade them, on condition that the equipment is then made available to researchers elsewhere in the EEC or, at first, elsewhere in Europe. Support will be provided for periods of three to five years. DGXII's hope is that it will soon have some 30 installations on its books.

On the more distant future, Fasella believes that the programmes of industrial research support will continue, even multiply, but that the Commission will find itself paying more attention to the needs of basic research. He says that many of DGXII's research activities, not simply its occasional grants to the European Science Foundation, help to form durable networks of people, which could usefully be multiplied.

H. J. Allgeier, director of the division responsible for planning and evaluation in DGXII and a strong advocate of the nascent aeronautics programme, goes further, acknowledging that it may not be long before the Commission has to face up to the responsibility of "standing behind" research institutions such as CERN and the European Space Agency (ESA). But at this stage, nobody seems willing to go to

the stake for turning the Commission's research programme into EEC's public grant-making agency.

It is not easy to see how this question will get the hearing within EEC that its importance demands. Most member governments are worried about their own economic performance in relation to that of other member states and also share the general view that competing with the United States or Japan (or both) is what EEC is for. They take the simple view that backing industrial research makes sense, but at the same time value the ability (or illusion) of seeming to shape national policy which national grant-making agencies can provide.

It is also the case that the Commission is not constitutionally well-suited to the role of a grant-making agency dedicated to the support of basic research and the pursuit of excellence. There would be obvious political difficulties if the research grants awarded by the Commission's hypothetical grant-making agency were not *pro rata* with member states' estimates of their national importance (by the yardstick of population, GDP or whatever). More seriously, most well-judged research grants would be discriminatory, not involving transnational collaboration, which the Commission is meant to foster.

There are nevertheless two directions in which the Commission could usefully feel out the ground ahead. First, it is anomalous that the Commission has so little direct concern with skill training and higher education; direct support of basic research might be a useful entrée.

Second, it would be entirely consistent with the Commission's present function that it should play a direct part in supporting collaborative research institutions, CERN, ESA and the smaller fry. Member governments would suspect that to be a way of spending their money, by proxy and with less attention than they would exercise themselves, but there are many formulae by which the obvious dangers could be avoided. Why not make a few experiments? The VLBI proposal (page 720) would be a natural starting-point.

Commission support for basic research in member states might also be held germane to the Commission's function if it were regarded as one of the means by which economic imbalances within EEC might be in the long run corrected. There is already a Social Fund providing palliative cash. Why not research funds as well? Given that less prosperous member states' ability and readiness to spend money on basic research will always be deficient, the Commission's intervention may be the only sure way of increasing the general level of research spending in the Community.

which more than 100 researchers from eight Community countries are involved, is the study of plankton in the Antarctic seas organized by the Alfred Wegener Institute at Bremerhaven, in West Germany. Material was collected from the research vessel *Polarstern* during the Antarctic summer just completed, but its analysis will take a further two years (to which the Commission will contribute 551,000 ECU). And six marine science laboratories plan to study Quaternary sedimentation in the North Sea by means of a series of boreholes and with the help of a 1.51 million ECU grant over two years.

Among the grants CODEST did not make last year is that to which *Nature* has given some publicity — the proposal by the European VLBI consortium of radio-astronomers that the Commission should finance its plan for the re-equipment of the collaborating observatories and also support the proposed centre for the analysis of VLBI data at a cost of 17.8 million ECU.

In reality, the VLBI proposal would have consumed the whole of the SCIENCE budget for a year. The issue that remains to be decided is not whether the SCIENCE programme must be enlarged, but whether the Commission should devise a new mechanism for meeting such requests, which is subsidiary to the question of what the Commission's role in basic research is judged to be.

With all that said, in its small way, SCIENCE seems to enjoy a degree of flexibility not common in the Commission's works. Being small no doubt helps, but so does the advisory committee called CODEST which ultimately decides which projects shall succeed. (First, there is a refereeing procedure.) As if in recompense for its time and trouble in cutting up the small cake, CODEST has the right to be consulted about all proposals for developments in science and technology making their way to the Commission.

The chairman of CODEST since 1987 is Sir Peter Swinnerton-Dyer, chairman of the British University Grants Committee until that was transmogrified into the Universities Funding Council, of which he is now the chief executive. Unlike most of the Commission's advisory committees, CODEST members are not representatives of their governments but independent persons, which also gives the committee more legitimacy than that attaching to groups of government nominees.

Given the influence of CODEST in the Commission's scheme of things, as well as its independence, it is probably the institution in the EEC best placed to raise the important question of what the balance between basic and applied research should be. There is not much time left for tackling the question: the next Framework programme will be upon us before we know.

# Unprepared for the single market

Will it be different after 1992? The general expectation that everything in Europe will change when the EEC (at last) becomes a common market is belied by the inadequacy of the preparation for that event.

THE EEC's research programme, the subject of the last part of this survey of European science, has always been controversial and will long remain so. The Treaty of Rome omitted to give the European Commission the power to sponsor research, because in the simple customs union then foreseen, the Commission needed merely the power to create the level playing-field on which companies in member states could compete on equal terms. In the 1950s, before research became a self-conscious component of public policy and long before governments recognized the link between research and prosperity, research belonged with cultural policy squarely within the competence of member states. Both the Iron and Steel Community and Euratom (which predated EEC) had research remits, but they had technical needs to satisfy.

Since then, the Commission has stumbled into research by historical accident — the coincidence of its administrative takeover of the two subsidiary communities with the rise of European anxieties in the 1970s about the 'technology gap' between Europe and the rest of the industrialized world. The Commission has responded manfully, but not always wisely, to this challenge. Its programmes described in the preceding pages are merely the most conspicuous. Yet now, with the prospect of a single market going beyond a mere customs union, there can be no doubt that the Commission has a proper role in research. The Single Act that promises great things for 1992 acknowledges as much. The danger now is that what it does will be the extrapolation into the future of present historical accidents. Several questions arise.

First, there is the matter of administration. In part, the Commission has been unfairly pilloried. The Joint Research Centre (once named in the plural) was in a bad way when the Commission took it over. Now, at least, there is a workable structure and a plan that may succeed (page 732). It should be given a fair chance. The more expensive cost-sharing programmes (page 729) are a more mixed bag. Much of the work they support is valuable — the evaluation panels say so — but they would be more valuable if they were not so often hastily thrown together. Often the Commission will spend well over a year winning approval for some scheme, give client companies and academics a few months in which to apply — and then spend more than a year making legal arrangements for the funds to be released.

Second, there is the matter of what the Commission's research is for. As stated, the purpose is to enhance industrial "competitiveness" while supporting only "precompetitive" industrial research. The Farge panel last year spotted that contradiction. Another, certain to seem sharper after 1992, is whether it will make sense to

insist that industrial research projects qualifying for assistance should always entail transnational collaboration when European competitiveness (with the outside world) could be based on a single efficient company. A further difficulty is that these projects seem to concentrate on innovation (often the 'me-too' kind) rather than efficiency, suggesting that self-sufficiency is the real goal.

Third, there is the matter of the balance between basic and applied research. The Commission has so far concentrated on the second, but acknowledges that Europe's future hangs not only on a torrent of innovation but on a sufficient supply of innovative people. The logic of that is that it should be spending a greater proportion of its funds on basic research, which is the only proven way of systematically turning talented people into innovators. The SCIENCE programme (page 734) is fine, but should be increased and also supplemented by a means of backing long-term institutional endeavours. The planned, but frustrated, VLBI scheme (page 719) is a test-case.

Fourth, there is the matter of the Commission's own dependence on science. Even among its constituents, the Commission has a bad name for making technical decisions in apparent ignorance of the ins and outs of technical questions. The decision last year to ban the use of anabolic steroids in growing beef followed the over-stringent standards for radioactive materials in food adopted in the aftermath of Chernobyl two years ago. But the Commission corporately is not nearly as ignorant as it makes itself seem. It is merely that when technicalities contradict what seem to be political, social or economic imperatives, it is easier to make a decision by neglecting to ask for the inconvenient advice. That may keep member-governments happy, but it is not a way to govern.

Finally, there is the related matter of the Commission's own personnel, researchers on its payroll, for example. As things are, the Commission is compelled by its member governments to operate a quota system: governments do not want to stuff ECUs into other nationals' pockets, especially in such large amounts. Will petty chauvinism of that kind make sense after 1992? And if not, how else are talented people to be employed? The question is again administrative, but it also goes deeper: the Commission expects 1992 to be a milestone on the way to a United States of Europe. If it had its time again, the Commission would no doubt start from somewhere other than the Treaty of Rome, perhaps from a common understanding on external relations. But history does not repeat itself for the benefit of those whom it inconveniences. The Commission's flair for dealing with its officials as if they were European could be another acid test of the validity of its ambitions for Europe. □

# Are you a science detective?

Do you spend hours searching the library shelves for clues to the whereabouts of this week's issue of Nature or waste time tracking down the last person on the circulation list?

Whether it's the latest developments in AIDS vaccines, maps of the sea bottom, debates on Darwinism or details on supernovae explosions that you're looking for, you need search no longer.

A personal subscription to Nature puts the most recent scientific developments in your hands only hours after the text goes to the printers.

Not only that, but you can read Nature at your leisure without fear of being chased by librarians or colleagues frantic for that one treasured copy.

You can even build up a permanent Nature reference library with its own Nature Index to make the information instantly accessible and ready to hand.

## Stop the search now

Take out a personal subscription to Nature today at **HALF PRICE**.

# The Temperature Cycler That Can Hold Up To 58 Samples In A Single Experiment...

## Or Up To 29 Samples In Two Separate Simultaneous Experiments!

It's true. The **fully programmable** TwinBlock™ System can do the work of two temperature cyclers. That's because the TwinBlock System has two heating blocks under independent microprocessor control. So it can run two different, **totally independent** experiments simultaneously using as many as 29 samples in each test.

Laboratories around the world use Ericomp's temperature cyclers to heat and cool test samples **automatically** through repeated cycles for any of several user-defined time intervals and temperatures ranging from 25° to 100° Centigrade.

- Like having two machines for the price of one
- Proven reliability
- Prompt, on-schedule delivery

If your lab needs a low priced convenient alternative to temperature cycling, our general purpose microprocessor controlled incubator is the ideal solution.

Call **1-800-541-8471** today to discover how the TwinBlock System can double your research flexibility and save your lab time and money. Outside U.S. call 619-457-1888.

# A safe, simple protein detection system by Promega.

**ProtoBlot<sup>®</sup>**  
Western Blotting  
Systems

## The ProtoBlot<sup>®</sup> Western Blotting Systems from Promega — For the Rapid, Sensitive Immunodetection of Proteins.

Choice of alkaline phosphatase-based or horseradish peroxidase-based detection systems:

- Safe — Eliminates the need for radioactive isotopes
- Sensitive — Provides picogram-level sensitivity, greater than <sup>125</sup>I-protein A-based systems
- Optimized — Reproducible, reliable results
- Fast — Protein detection in as little as 2 hours
- Choice — Systems available for the detection of mouse, rabbit, and human antibodies
- Complete — All essential components plus easy-to-follow, detailed protocols provided
- Low cost — starter systems available
- Support — Promega's experienced support staff is always ready to provide assistance for your specific applications

# ANNOUNCING **M<sub>μ</sub>TI-FLEX<sup>®</sup> DUCKBILL<sup>™</sup>** 0.2 mm and 0.2 mm (E)

**M<sub>μ</sub>TI-FLEX<sup>®</sup> TIPS** are now available for loading ultra-thin gels of less than 0.2 mm.

## Advantages:

RNase-free

Metal-free clarity allows accurate and complete delivery of small sample volumes, in the 0.5 to 10  $\mu$ l range.

Flat tips allow compact sample loading in very thin gels, e.g., as used in DNA sequencing.

Long tips reach easily to the bottom of wells for loading samples in gel electrophoresis, and can reach the bottoms of long test tubes and microcuvettes.

Narrow tips permit tight sample application for TLC.

Flexibility allows access to hard-to-reach areas and aids in application of samples to very thin gels.

Universal fit. Multi-Flex tips employ a unifit design for absolute sealing on small volume (1-200 $\mu$ l) sizes of Finnpiptette, Pipetman, Eppendorf, Socorex, MLA and Volac air displacement pipettors.

## Applications:

Manipulations of very small sample volumes

Restriction enzyme digests  
Nick translations  
Enzyme assays  
DNA sequencing reactions  
Immunoprecipitations

Loading samples for electrophoresis

SDS-PAGE for proteins  
Horizontal agarose gels  
DNA sequencing gels

Spotting samples for TLC

Loading and unloading microcuvettes

Many other uses

**THE LID STAYS ON THE  
MICROCENTRIFUGE TUBE  
WITH THE  
M<sub>μ</sub>TI-Cap-Lock<sup>™</sup>**  
PATENT PENDING

## Durability

Multi-Cap Lock<sup>™</sup> secures the cap on microcentrifuge tubes and remains intact when subjected to the following conditions:

1. Freezing and storing.
2. Transfer frozen samples to boiling water.
3. Centrifuging to (>16,000 x g).
4. Secure to internal positive pressure of 120 PSI.

## Practicality and Uses

1. Provides peace of mind when processing radioactive, pathogenic or chemically hazardous samples.
2. Prevents valuable sample loss due to caps unexpectedly popping open.
3. Eliminates sample "flooding" and contamination caused by caps opening when boiling or heating in a water bath.
4. Can be used to color code samples and follow them through lengthy procedures.
5. Labeling on top of tube remains visible with Multi-Cap Lock<sup>™</sup> in place.
6. Fits Multi-Click<sup>™</sup> Seal Tubes (1.7 and 2.0 ml. tubes)
7. Reusable.
8. Shipping of expensive enzymes and reagents.

**TaqTrack™**  
Sequencing  
System

Sequence of M13mp18 on a 6% polyacrylamide/7M urea gel using the pUC/M13 forward 24mer primer and [ $\alpha$ - $^{32}$ S]dATP.

# Another new *Taq* sequencing solution by Promega.

## Two Solutions to Sequencing Difficult DNA Templates.

### Choice of 2 protocols:

- End label protocol for sequencing ssDNA and dsDNA templates including lambda DNA and amplified DNA
- Two-step internal labeling protocol which allows you to take advantage of the properties of  $^{35}$ S for sequencing ssDNA

### Both protocols offer these benefits:

- Sequence at 70-90°C with thermostable *Taq* DNA polymerase
- Solve difficult template problems
  - GC-rich templates
  - Long hairpins
- Observe consistent band intensity
- Actually read from 1-500 bases
- Avoid lengthy chemical methods

# Applied Biosystems has electrified DNA research.

We've electrified DNA research in more ways than one. As pioneers in developing innovative automated products for molecular biologists, we have the hands-on experience and technical expertise needed to deliver the high-powered instruments that have vitalized DNA research. You can choose leading-edge instruments for automatic extraction, sequencing, synthesis, and purification of DNA.

## Unique DNA Extractor

Our one-of-a-kind, automated extractor has put an end to tedious, time-consuming manual procedures and virtually eliminated exposure to toxic chemicals. Now researchers can count on consistent, high-quality results. And, best of all, exciting new applications for the instrument are constantly being introduced.

## New Standards in DNA Sequencing

We introduced the world's first automated fluorescent-based DNA sequencer. With our sequencer, researchers can now conceive of large sequencing projects previously impossible. Now you can interpret up to 8,000 bases per gel. Our new Taq polymerase reagent kit simplifies preparing extensions and delivers longer runs with improved accuracy over conventional sequencing chemistries.

# Observation of cold nuclear fusion in condensed matter

S. E. Jones\*, E. P. Palmer\*, J. B. Czirr\*, D. L. Decker\*, G. L. Jensen\*, J. M. Thorne\*, S. F. Taylor\* & J. Rafelski†

\* Departments of Physics and Chemistry, Brigham Young University Provo, Utah 84602, USA

† Department of Physics, University of Arizona, Tucson, Arizona 85721, USA

When a current is passed through palladium or titanium electrodes immersed in an electrolyte of deuterated water and various metal salts, a small but significant flux of neutrons is detected. Fusion of deuterons within the metal lattice may be the explanation.

FUSION of the nuclei of isotopes of hydrogen is the principal means of energy production in the high-temperature interiors of stars. In relatively cold terrestrial conditions, the nuclei are surrounded by electrons and can approach one another no more closely than is allowed by the molecular Coulomb barrier. The rate of nuclear fusion in molecular hydrogen is then governed by quantum-mechanical tunnelling through that barrier, or equivalently, the probability of finding the two nuclei at zero separation. In a deuterium molecule, where the equilibrium separation between deuterons (d) is 0.74 Å, the d-d fusion rate is exceedingly slow, about  $10^{-74}$  per  $D_2$  molecule per second<sup>1</sup>.

By replacing the electron in a hydrogen molecular ion with a more massive charged particle, the fusion rate is greatly increased. In muon-catalysed fusion, the internuclear separation is reduced by a factor of  $\sim 200$  (the ratio of the muon to electron mass), and the nuclear fusion rate correspondingly increases by about eighty orders of magnitude. Muon-catalysed fusion has been shown to be an effective means of rapidly inducing fusion reactions in low-temperature mixtures of hydrogen isotopes<sup>2,3</sup>.

A hypothetical quasi-particle a few times as massive as the electron would increase the cold fusion rate to readily measurable levels of  $\sim 10^{-20}$  fusions per d-d molecule per second<sup>1</sup>. The results reported here imply that a comparable distortion of the internuclear wavefunction can be realized when hydrogen isotope nuclei are loaded into metals under certain conditions. We have discovered a means of inducing nuclear fusion without the use of either high temperatures or radioactive muons.

## Indirect evidence

Observations of naturally occurring  $^3\text{He}$  in the Earth suggested to us new directions for laboratory investigations of nuclear fusion in condensed matter.  $^3\text{He}$  is produced by the following fusion reactions:

Tritium (t) decays with a 12.4-yr half-life to produce  $^3\text{He}$ . The well established high  $^3\text{He}/^4\text{He}$  ratio in solids, liquids and gases associated with volcanoes and other areas of high heat flow<sup>4-6</sup> suggests fusion as a possible source for the  $^3\text{He}$ .

To estimate a possible rate of fusion in the Earth, we assume a simple, steady-state model in which the known flux of  $^3\text{He}$  out of the mantle,  $2 \times 10^{19}$   $^3\text{He}$  atoms per second<sup>7</sup>, arises from p-d fusion occurring uniformly in the mantle water reservoir, taken as  $\sim 1.4 \times 10^{24}$  g (R. Poreda, personal communication). Note that if the Earth contains 'primordial'  $^3\text{He}$ , our calculated

rate will be an upper limit; on the other hand, if fusion-produced  $^3\text{He}$  is stored in the mantle (so that the outward flux does not equal the production rate), our value will be a lower limit. As each p-d fusion produces one  $^3\text{He}$  atom, and as the isotopic abundance of deuterium in water is  $\sim 1.5 \times 10^{-4}$  deuterons per proton, we infer a geological fusion rate constant,  $\lambda_f$ , of

$$\lambda_f \approx \frac{2 \times 10^{19} \text{ } ^3\text{He atoms s}^{-1}}{1.4 \times 10^{43} \text{ deuterons}} \quad (3)$$

$$\approx 10^{-24} \text{ fusions d}^{-1} \text{ s}^{-1}$$

This rate is fifty orders of magnitude larger than that expected in an isolated HD molecule, and fusion at this rate could be detected if reproduced in the laboratory.

Cold nuclear fusion may be important in celestial bodies other than the Earth. Jupiter, for example, radiates about twice as much heat as it receives from the Sun. It is interesting to consider whether cold nuclear fusion in the core of Jupiter, which is probably metallic hydrogen plus iron silicate, could account for its excess heat. Heat is radiated at an approximate rate of  $10^{18}$  watts, which could be produced by p-d fusions occurring at a rate of  $10^{30} \text{ s}^{-1}$ . Assuming a core of radius  $4.6 \times 10^9$  cm, containing mostly hydrogen, with density  $\sim 10 \text{ g cm}^{-3}$  and a deuteron/proton ratio of  $\sim 10^{-4}$ , we deduce a required p-d fusion rate of  $\lambda_f \approx 10^{-19}$  fusions  $\text{d}^{-1} \text{ s}^{-1}$  if all the heat derives from fusion. Catalysed nuclear fusion at this rate could be readily measured in the laboratory.

Further evidence for cold nuclear fusion in condensed matter comes from studies of  $^3\text{He}$  and  $^4\text{He}$  in metals. There have been several reports of high  $^3\text{He}$  concentrations in metal crucibles and foils (H. Craig, R. Poreda, A. Nier, personal communications), consistent with *in situ* formation by cold fusion. In particular, Mamyrin *et al.*<sup>8</sup> report the occurrence of patchy, high concentrations of  $^3\text{He}$  in a number of metal foils. Electrolytic refining of the metals could have provided the appropriate conditions for the cold nuclear fusion reactions (1) and possibly (2). Among several possible explanations for the observations, the authors suggest an analogue of muon catalysis<sup>8</sup>.

## Detection of cold-fusion neutrons

The considerations outlined above led to laboratory experiments performed at Brigham Young University to determine whether cold nuclear fusion can actually occur in condensed matter. We now report the observation of deuteron-deuteron fusion at room temperature during low-voltage electrolytic infusion of deuterons into metallic titanium or palladium electrodes. The fusion reaction (2a) is apparently catalysed by the deposition of  $d^+$  and metal ions from the electrolyte at (and into) the negative electrode. Neutrons with an energy of  $\sim 2.5$  MeV are clearly detected with a sensitive neutron spectrometer. The experimental layout is shown in Fig. 1.

The neutron spectrometer, developed at Brigham Young University over the past few years (ref. 9 and manuscript in preparation) has been crucial to the identification of this cold fusion process. The detector consists of a liquid organic scintillator (BC-505) contained in a glass cylinder 12.5 cm in diameter, in

which three glass scintillator plates doped with lithium-6 are embedded. Neutrons deposit energy in the liquid scintillator through multiple collisions, and the resulting light output yields energy information. As their energy decreases, the neutrons are scavenged by  $^6\text{Li}$  nuclei, and the reaction  $n + ^6\text{Li} \rightarrow t + ^4\text{He}$  results in scintillations in the glass. Pulse shapes and amplitudes from the two scintillators differ; the two distinct signals are registered by two photomultiplier tubes, whose signals are summed. A coincidence of identified signals from the two media within  $20\ \mu\text{s}$  identifies an incoming neutron that has stopped in the detector.

The spectrometer was calibrated using 2.9- and 5.2-MeV neutrons generated by deuteron-deuteron interactions at  $90^\circ$  and  $0^\circ$ , respectively, with respect to a deuteron beam from a Van de Graaff accelerator. The observed energy spectra show broad structures which imply that 2.45-MeV neutrons should appear in the multichannel analyser spectrum in channels 45–150. The stability of the detector system was checked between data runs by measuring the counting rate for fission neutrons from a broad-spectrum californium-252 source.

We have performed extensive tests to verify that the neutron spectrometer does not respond preferentially in this pulse height range to other sources of radiation such as thermal neutrons. In particular, we made unsuccessful efforts to generate false 2.5-MeV neutron 'signals' by using various  $\gamma$ -ray and neutron sources and by turning auxiliary equipment on and off. Neutron-producing machines such as the Van de Graaff accelerators were off during all foreground and background runs.

Many background runs were made using operating cells (described below) containing standard electrodes and electrolytes, except that  $\text{H}_2\text{O}$  replaced the  $\text{D}_2\text{O}$ ; other background runs were made using both new and previously used standard cells containing  $\text{D}_2\text{O}$  plus the usual electrolyte but with no electrical current. The individual background runs were all featureless and closely followed the pattern of the integrated background shown in Fig. 2. Background rates in the neutron counter are  $\sim 10^{-3}\ \text{s}^{-1}$  in the energy region where 2.5-MeV neutrons are anticipated. By comparing energy spectra from  $\gamma$ -ray and neutron sources we have determined that approximately one-fourth of the observed background events arise from accidental coincidences of  $\gamma$ -rays and three-fourths from ambient neutrons. The  $\gamma$ -ray background comes mainly from radioactive radium and potassium in the surrounding materials.

We attribute the ambient neutrons to cosmic-ray sources. Although the typical neutron evaporation spectrum (at birth) has a broad maximum near 2.5 MeV (ref. 10), Monte Carlo calculations show that moderation in the source medium (predominantly the shielding surrounding the detector) will wash out this structure and produce a smoothly decreasing background spectrum above 0.5 MeV, as observed.

The predicted and measured absence of structure in the spectrum of cosmic-ray-produced neutrons will not be influenced by the relatively small temporal variations that may occur in the cosmic-ray flux, such as the observed decreases that may accompany solar flares. This means that the observed peak at 2.5 MeV cannot be accounted for by ambient-neutron background variations, because, as explained below, the analysis is based on the shape of the spectra and not simply on rates. Low-energy cosmic-ray muons would be rapidly scavenged by nuclei with high atomic number, so as to reduce muon-catalysed d-d fusion to a negligible level<sup>2,3</sup>. Considering volume and solid angle, the rate of production of neutrons by muons absorbed by carbon nuclei in the detector exceeds that from muons absorbed by oxygen nuclei in the electrolytic cells by a factor of  $\sim 60$ . Thus, the presence or absence of electrolytic cells is an unimportant perturbation in the background.

During the search for suitable catalytic materials, the following (unoptimized) prescription for the electrolytic cells evolved. It began with salts typical of volcanic hot springs and included electrode-metal ions. The electrolyte is typically a mixture of  $\sim 160\ \text{g}\ \text{D}_2\text{O}$  plus various metal salts in  $\sim 0.1\ \text{g}$  amounts each:  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ,  $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$ ,  $\text{PdCl}_2$ ,  $\text{CaCO}_3$ ,  $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ ,  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ ,  $\text{CaH}_4(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$ ,  $\text{TiOSO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ , and a very small amount of  $\text{AuCN}$ . The pH is adjusted to  $\leq 3$  with  $\text{HNO}_3$ . All 14 runs reported here began with this basic electrolyte.

Titanium and palladium, initially selected because of their large capacities for holding hydrogen and forming hydrides, were found to be effective negative electrodes. Individual electrodes consisted of  $\sim 1\ \text{g}$  purified 'fused' titanium in pellet form, or  $0.05\ \text{g}$  of  $0.025\text{-mm}$ -thick palladium foils, or  $5\ \text{g}$  of mossy palladium. Typically 4–8 cells were used simultaneously. The palladium pieces were sometimes re-used after cleaning and roughening the surfaces with dilute acid or abrasives. Hydrogen bubbles were observed to form on the Pd foils only after several minutes of electrolysis, suggesting the rapid absorption of

FIG. 1 Schematic diagram of the experiment. Electrolytic cells are shown on top of the neutron spectrometer.

deuterons into the foil; oxygen bubbles formed at the anode immediately. Gold foil was used for the positive electrodes. Direct-current power supplies provided 3–25 volts across each cell at currents of 10–500 mA. Correlations between fusion yield and voltage, current density, or surface characteristics of the metallic cathode have not yet been established.

Small jars, ~4 cm high and 4 cm in diameter, held ~20 ml of electrolyte solution each. The electrolytic cells were placed on or alongside the neutron counter, as shown in Fig. 1. The present cells are simple and undoubtedly far from optimum. Nevertheless, the present combination of our cells with the neutron spectrometer is sufficient to establish the phenomenon of cold nuclear fusion during electrolytic infusion of deuterium into metals.

Figure 2 shows the energy spectrum obtained under the conditions described above, juxtaposed with the (scaled) background spectrum. We acquired about twice as much background data as foreground data. Assuming conservatively that all deviations from background are statistical fluctuations, we scale the background counts by a factor of 0.46 to match the total number of foreground counts over the entire energy range shown in Fig.

A feature in channels 45–150 rises above background by nearly four standard deviations. This implies that our assumption is too conservative and that this structure represents a real physical effect. After re-scaling the background by a factor of 0.44 to match the foreground levels in regions just below and just above this feature, the difference plot (Fig. 3) is obtained. It shows a robust signal centred near channel 100, with a statistical significance of almost five standard deviations. A gaussian fit to this peak yields a centroid at channel 101 with a standard deviation of 28 channels, and an amplitude of  $23.2 \pm 4.5$  counts. Both the position and width of this feature correspond to those expected for 2.5-MeV neutrons, according to the spectrometer calibration. The fact that a significant signal appears above background with the correct energy for d–d fusion neutrons (~2.5 MeV) provides strong evidence that room-temperature nuclear fusion is occurring at a low rate in the electrolytic catalysis cells.

### Fusion rate determination

It is instructive to examine the fourteen individual runs which enter into the combined data discussed above. These runs were performed over the period 31 December 1988 to 6 March 1989. Figure 4 displays, for each run, the ratio of foreground count rate in the 2.5-MeV energy region to the background rate

FIG. 2 Foreground (solid) and background (dashed) counts as a function of pulse height (corresponding to neutron energy) in the neutron spectrometer. Ten counts have been added to each three-channel bin for clarity of presentation.

FIG. 3 Difference spectrum obtained by subtracting scaled background from the foreground. Statistical errors ( $\pm 1\sigma$ ) are shown for each eight-channel bin.

obtained for each run. Electronic changes were made in the apparatus during the course of the experiment which altered the observed background rates, so we plot the data in terms of foreground-to-background ratios rather than absolute rates. In one set of data (runs 1 to 8) for which the system was kept as untouched as possible to avoid changes in background rates, the measured rate of detection of 2.5-MeV neutrons was  $(6.2 \pm 1.3) \times 10^{-4} \text{ s}^{-1}$  above background. For this set of data, the background and foreground rates for all energies above ~3 MeV (that is, for all channels from 190 to 512) are equal, at  $(1.4 \pm 0.1) \times 10^{-3} \text{ s}^{-1}$ .

Run 6 is particularly noteworthy, with a statistical significance of approximately five standard deviations above background. Fused titanium pellets were used as the negative electrode, with a total mass of ~3 g. The neutron production rate increased after about one hour of electrolysis. After about eight hours, the rate dropped dramatically, as shown in the follow-on run 7. At this time, the surfaces of the titanium electrodes showed a dark grey coating. An analysis using electron microscopy with a microprobe showed that the surface coating was mostly iron, deposited with deuterons at the cathode. The same phenomenon of a decrease in the neutron signal after about eight hours of operation appears in run 13 followed by run 14. Runs 13 and 14 use the same eight electrochemical cells, and again the negative electrodes developed coatings after a few hours of electrolysis. These observations suggest the importance of surface conditions for the cold fusion process. Variations in surface conditions and electrolyte composition are anticipated during each test run because materials plate out of solution; the solution pH also changes significantly during a run. These 14 runs represent two choices of electrode material plus various operating currents. These variations may account for the fluctuations in the signal level that are evident in Fig. 4. As these runs represent a total of only ~200 signal neutrons at an average rate of ~2 per hour, it was difficult to optimize experimental conditions. This is a task for future research.

The observed 'turning off' of the signal after about eight hours may account for low signal-to-background ratios in runs 1 and 3, in that a signal that lasted for only a few hours may have been overwhelmed after a long (~20-hour) running time. When run 10 started with rates substantially above background, we stopped the run and removed half of the electrochemical cells as a test. The neutron production rate dropped off as expected (run 11). In determining the statistical significance of the data, we included runs 1, 3, 7, 11 and 14, even though we see a

FIG. 4 Ratio of foreground rate to background rate for each run, in the 2.5-MeV energy region of the pulse-height spectrum. Statistical errors ( $\pm 1\sigma$ ) are shown.

systematic reason for their low foreground-to-background ratios as explained above. Run 8, shown in Fig. 4, was inadvertently lost from the magnetic storage device and could not be included in Figs 2 and 3. This does not change our conclusions.

We can estimate the rate for the neutron-production branch of d-d fusion during electrolysis, specifically for run 6, as follows:

$$\text{Fusions per deuteron pair per second} = \frac{R/\epsilon}{M \times \frac{d}{2M}} \quad (4)$$

where the observed rate of neutron detection,  $R = (4.1 \pm 0.8) \times 10^{-3} \text{ s}^{-1}$ , is based on foreground minus corresponding background counts in channels 45–150; the neutron detection efficiency, including geometrical acceptance, is calculated using a Monte Carlo neutron-photon transport code<sup>11</sup> to be  $\epsilon = (1.0 \pm 0.3)\%$ ;  $M \approx 4 \times 10^{22}$  titanium atoms for 3 g of titanium; and the ratio of deuteron pairs to metal ions,  $d/2M \approx 1$ , is based on the assumption that nearly all tetrahedral sites in the titanium lattice are occupied, forming the  $\gamma\text{-TiD}_2$  hydride. Then the estimated cold nuclear fusion rate for the neutron-production branch, by equation (4), is  $\lambda_f \approx 10^{-23}$  fusions per deuteron pair per second. If most fusions take place near the surface, or if the titanium lattice is far from saturated with deuterons, or if conditions favouring fusion occur intermittently, then the inferred fusion rate must be much larger, perhaps  $10^{-20}$  fusions per deuteron pair per second.

We note that such a fusion rate could be achieved by 'squeezing' the deuterons to about half their normal ( $0.74 \text{ \AA}$ ) separation in molecules. That such rates are now observed in condensed matter suggests catalysed 'piezonuclear' fusion as the explanation<sup>1</sup>. A possible cause is that quasi-electrons form in the deuterated metal lattice, with an effective mass a few times that of a free electron. Isotopes of hydrogen are known to accumulate at imperfections in metal lattices<sup>12</sup>, and a local high concentration

of hydrogen ions might be conducive to piezonuclear fusion. Because we have not seen any evidence for fusion in equilibrated, deuterated metals or compounds such as methylamine- $\text{d}_2$ , deuteriochloride or ammonium- $\text{d}_4$  chloride, we conclude that non-equilibrium conditions are essential. Electrolysis is one way to produce conditions that are far from equilibrium.

It may seem remarkable that one might influence the effective rate of fusion by varying external parameters such as pressure, temperature and electromagnetic fields, but just such effects are seen in another form of cold nuclear fusion, muon-catalysed fusion<sup>13</sup>.

## Conclusions

The correlation of ideas regarding cold piezonuclear fusion<sup>1</sup> with observations of excess  $^3\text{He}$  in metals and in geothermal areas of the Earth led to our experimental studies of fusion in electrochemical cells, which began in May 1986. Our electrolyte compositions evolved from geochemical considerations, and changed as results were observed. The presence of a fusion neutron signal was consistently reproduced, although the rate varied widely. Now that our exploratory searches have disclosed a small piezonuclear fusion effect, it remains to disentangle the factors that influence the fusion rate.

The need for off-equilibrium conditions is clearly implied by our data, and suggests that techniques other than electrochemistry may also be successful. We have begun to explore the use of ion implantation and of elevated pressures and temperatures, mimicking geological conditions. Cold nuclear fusion in condensed matter may be of interest as a novel probe of metal-hydrogen systems, including geological ones, and as a source of monoenergetic neutrons. If deuteron-deuteron fusion can be catalysed, then the d-t fusion reaction is possibly favoured because of its much larger nuclear cross-section. Although the fusion rates observed so far are small, the discovery of cold nuclear fusion in condensed matter opens the possibility, at least, of a new path to fusion energy. □

# Differing strategies for organizing anterior and posterior body pattern in *Drosophila* embryos

Gary Struhl

Howard Hughes Medical Institute, Center for Neurobiology and Behavior, Columbia University College of Physicians and Surgeons, 722 W. 168 Street, New York, New York 10032, USA

Opposing anterior and posterior morphogen systems specify the segmented body pattern of *Drosophila*. The anterior morphogen, *bicoid*, exerts a direct, instructive influence on head and thoracic pattern by triggering different outcomes according to changes in its concentration along the body. In contrast, the posterior morphogen, *nanos*, simply defines where abdominal patterning can occur by eliminating an otherwise ubiquitous repressor, *hunchback* protein, from the posterior half of the embryo. Within this *hunchback*-free domain the pattern of abdominal segments must be specified by other morphogens, possibly by shorter range gradients of the products of zygotic gap genes *Kruppel*, *knirps* and *tailless*.

THE body plan of *Drosophila* is laid down in response to opposing morphogen gradients emanating from localized sources at each pole of the embryo<sup>1-3</sup>. The anterior morphogen, *bicoid* (*bcd*), appears to organize head and thoracic pattern by directly dictating the spatial expression of several subordinate signalling molecules<sup>4-7</sup>. In this regard, it behaves as a classical gradient morphogen, triggering a series of distinct results according to its changing concentration along the body<sup>8,9</sup>. Less is known about the posterior morphogen, *nanos* (*nos*)<sup>3,10,11</sup> although diffusion or transport of this molecule from the posterior pole towards the middle of the early embryo is normally essential for the development of abdominal pattern<sup>2</sup>.

The *bicoid* (*bcd*)<sup>1,3-7</sup> and *nanos* (*nos*)<sup>3,10,11</sup> morphogens profoundly influence the patterns of expression of many subordinate signalling molecules<sup>4-7,12-15</sup>. Although most of these effects are likely to be indirect, it is notable that both morphogens play early and major roles in generating restricted anterior expression of the protein product of the gap gene *hunchback* (*hb*; refs 12-14)<sup>5</sup>. The *hb* gene is first expressed during oogenesis and its transcripts are deposited throughout the egg<sup>17</sup>. Following fertilization, *nos* morphogen emanating from the posterior pole appears to destabilize these maternal transcripts, thereby preventing early expression of *hb* protein in the posterior half of the embryo<sup>5,17,18</sup>. Shortly thereafter, *bcd* morphogen spreading from the anterior pole triggers the transcriptional activation of the *hb* gene in the anterior half of the body<sup>5,9,18</sup>.

Zygotic activity of the *hb* gene under the control of the *bcd* gradient is critically required for the development of normal head and thoracic segments<sup>13,14</sup>; indeed it is sufficient for normal development to occur even in the absence of the maternal *hb* contribution<sup>13</sup>. In contrast, the role of the *nos* morphogen in repressing posterior *hb* expression is of unknown significance. The two experiments reported here test the significance of this interaction by determining what happens when the repression of *hb* is overridden or circumvented. In the first experiment, ectopic expression of the *hb* coding sequence in the posterior half of the body is shown to cause phenotypes which mimic those caused by absence of the posterior determinant system.

Conversely, the second experiment establishes that the requirement for the posterior morphogen can be obviated by inactivating maternally derived *hb* transcripts by other means. Taken together, these experiments establish that the *nos* morphogen influences the development of abdominal pattern primarily, if not exclusively, by precluding posterior *hb* expression. Hence, *nos* appears to have a permissive rather than an instructive role in generating the posterior pattern, providing a sharp contrast to the role of *bcd* in organizing anterior pattern.

## Results

**Ectopic *hb* expression causes *nos* mutant phenocopies.** Ectopic *hb* expression was generated by placing the coding sequence of the *hb* gene under the control of the *Drosophila hsp70* promoter<sup>19</sup>, integrating the hybrid *hsp70-hb* gene into the germ line via P-element mediated transformation<sup>20</sup>, and then activating transcription of the transformed gene by exposing embryos carrying it to heat shocks at various stages of their development (see legend to Fig. 1). As shown in Fig. 1*a-c*, heat shocking *hsp70-hb* embryos during the syncytial blastoderm stage generates a pattern of posterior *hb* expression similar to that of embryos lacking the posterior determinant system. When allowed to develop to hatching, such embryos give rise to larvae lacking or having severely reduced abdominal segmentation (Fig. 2*a-c*), a phenotype characteristic of larvae derived from embryos in which the *nos* morphogen is largely or completely inactive (for example, Fig. 2*d*)<sup>2,3,11</sup>. The loss of abdominal segmentation observed in both cases appears to arise in a similar fashion as indicated by the expression of the pair-rule gene *even-skipped* (*eve*)<sup>12,21,22</sup>. The periodic expression of this gene is one of the earliest manifestations of segmentation. As shown in Fig. 1*d-f*, heat-shocked *hsp70-hb* embryos show an altered pattern of *eve* expression which resembles that of embryos lacking the posterior determinant system.

Thus, driving inappropriate posterior expression of the *hb* protein in wild-type embryos is sufficient to cause phenotypes which mimic those associated with absence of the posterior determinant system. This result suggests that the *nos* morphogen may normally influence abdominal segmentation solely by destabilizing maternal transcripts of the *hb* gene, thereby precluding posterior expression of *hb* protein during early embryogenesis. If so, the posterior determinant system should only be required in embryos that receive functional maternal transcripts from the *hb* gene: embryos lacking such transcripts should develop normal abdominal patterns even if the *nos* morphogen is inactive. As described below, this prediction has been tested and confirmed by using X-ray-induced mitotic recombination to remove functional *hb* transcripts from single cells during the development of the female germ line<sup>23,24</sup>.

**The *nos* morphogen is superfluous in embryos lacking functional maternal *hb* transcripts.** Females homozygous for mutations in the *vasa* gene give rise to eggs in which the *nos* morphogen is inactive (refs 11, 25; Fig. 2*d*). These eggs also lack functional germ-cell determinants normally deposited at the posterior pole and hence give rise to agametic embryos. As shown in Fig. 3, it is possible to remove *hb* gene function from single germ cells in *vasa* females by irradiating larvae of the genotype *vas/vas*; *hb/+*. Of approximately 800 *vas/vas*; *hb/+* females irradiated

FIG. 1 Ectopic expression of the *hunchback* protein under *hsp70* control mimics the phenotype associated with absence of the posterior determinant *nanos*. *a* and *b*, Expression of *hb* protein in wild-type and *hsp70-hb* embryos 20 minutes after heat shock (15 min, 36 °C). *c*, Expression of *hb* protein in embryos derived from *vasa* females, which lack *nos* function (all embryos are in the twelfth nuclear division cycle following fertilization and are oriented with their anterior poles at the left; *vasa* mutant embryos were obtained from females homozygous for the *vasa*<sup>PD</sup> mutation). Note that wild-type embryos express *hb* protein exclusively in the anterior half (under the control of the anterior morphogen, *bcd*), whereas heat-shocked *hsp70-hb* and *vasa* embryos show ectopic expression of *hb* protein in the posterior half. *d*, *e* and *f*, Expression of *eve* protein in wild-type and *hsp70-hb* embryos 60 minutes after heat shock (10 min, 36 °C), and in *vasa* embryos, respectively (all embryos are in the later portion of the fourteenth nuclear division cycle, just before completing cellularization and beginning gastrulation, and are oriented as in *a*, *b* and *c*). The protein product of the *eve* gene is normally expressed in seven stripes at this stage (numbered 1–7 in the anterior to posterior direction). In both heat-shocked *hsp70-hb* and *vasa* mutant embryos, stripes 1 and 2, which are normally associated with the gnathal and anterior thoracic segments, are present, but broader than normal; however, stripes 3–6, which are normally associated with posterior thoracic segments and the first seven abdominal segments appear to be replaced by a domain of intermediate expression which seems to be fused to an enlarged stripe 7. The extent of this broad posterior domain is variable in both heat shocked *hsp70-hb* embryos as well as in *vasa* mutant embryos, although as shown here, the overall pattern is generally similar. Note that the extent of ectopic *hb* expression under *hsp70* control is variable: the embryo in *b* shows a typical example, although *hsp70-hb* expression is often so strong that the embryos appear to express *hb* protein uniformly. Note also that heat shocks administered any time after the blastoderm stage have no detectable effects on the pattern of body segments, even though high levels of ectopic *hb* expression are induced and persist for several hours.

**METHODS.** The *hsp70-hb* gene was constructed as follows: a 2.4-kb *Xba*I fragment from the *hb* gene containing the entire *hb* coding sequence

preceded by 15 nucleotides at the 5' end and followed by 152 nucleotides at the 3' end was excised from a genomic clone *pE8-B1000A* (kindly supplied by D. Tautz: ref. 17), and inserted into an *hsp70* expression plasmid such that it is positioned immediately downstream of the *hsp70* promoter<sup>19,29</sup> and upstream of the 3' untranslated portion of the  $\alpha$ 1 tubulin gene (including a putative transcriptional stop site (see ref. 30)). The resulting *hsp70-hb-tubulin* hybrid gene was then excised and inserted into the *ry*<sup>+</sup> P-element vector *Carnegie 20* (ref. 31) and integrated into the genome by P-element mediated transformation<sup>20</sup>. Two transformants were obtained, one of which, *HSHB-3*, contains an insert on the third chromosome. All of the experiments were performed using a stock which is homozygous for this insert. Embryos were heat-shocked as follows. Approximately staged embryos were obtained from timed egg collections, rinsed on a piece of nytex, and the nytex placed on the wet surface of an agar plate maintained at 36 °C. After 10 or 15 min (heat shocks of either duration gave indistinguishable results) the nytex was transferred to a fresh wet agar plate at 25 °C and incubated at that temperature until they were fixed for antibody staining or examined for their cuticular phenotypes (see Fig. 2). Embryos were stained for *hb* or *eve* protein as previously described<sup>32</sup> using rat anti-*hb* and rat anti-*eve* polyclonal antisera generously provided by P. Macdonald. Virtually all *hsp70-hb* embryos stained for *hb* antigen following heat shock show moderate to high levels of uniform *hb* expression superimposed on top of the normal pattern of *hb* expression (note however that embryos heat-shocked before the syncytial blastoderm stage do not show ectopic *hb* expression; also, ectopic *hb* expression was not observed in pole cells). The expression of *hb* protein induced by heat shocking *hsp70-hb* embryos increases progressively over a 1–2 hr interval following a 10 or 15-min heat shock, and slowly dissipates over a period of several hours thereafter. Most (> 90%) of the *hsp70-hb* embryos in the late phases of nuclear cycle 14 obtained following a 10-min heat shock 60 minutes earlier show abnormal patterns of *eve* expression similar to that shown in *e*, the principal variation being the extent of the posterior domain of expression (in a minority of cases, this broad domain appeared to partially resolve into two neighbouring domains). Older sibling embryos obtained in the same collections showed normal *eve* patterns of expression and segmental morphologies.

during the first or second larval instars, at least 24 gave rise to normal larval and adult progeny when outcrossed to wild-type males. As described in the legend to Fig. 3, all of the adult progeny from these females were shown to derive from *vas/vas*; *hb/hb* germ-line clones. Thus, *vasa* mutant embryos, which lack functional *nos* morphogen, can nevertheless develop into larvae and adults having normal abdominal patterns provided that they lack functional maternal transcripts of the *hb* gene.

## Discussion

The results presented here show that the primary, if not sole, role of the posterior determinant system is to prevent posterior expression of *hb* protein from maternal transcripts deposited throughout the egg. Similar conclusions have been reached independently by D. Tautz and colleagues (personal communication) on the basis of complementary experiments. These findings have several implications (see ref. 26 for a more extensive discussion of these points):

(1) Molecular role of the *nos* morphogen. The early and potentially exclusive role played by the *nos* morphogen in clearing maternal *hb* transcripts from the posterior half of the body suggests that it directly binds and destabilizes these transcripts. Both the *hsp70-hb* hybrid gene reported here, as well as an *hb-βgal* hybrid gene generated by Tautz *et al.* (personal communication) appear to be unaffected by the *nos* morphogen.

Transcripts from both of these hybrid genes lack most or all of the 3' untranslated portion of the endogenous *hb* transcript, suggesting that the target site for the *nos* morphogen may lie in this portion of the molecule.

(2) Molecular role of the *hb* protein. The posterior determinant is thought to control abdominal segmentation by controlling the regional activation of the gap gene *knirps* (*kni*)<sup>3,11</sup>. This supposition was initially based on the phenotype of *kni* mutant embryos that resembles that associated with mutations which partially inactivate the *nos* morphogen, and is supported by preliminary molecular studies of U. Nauber and colleagues (unpublished data, cited in refs 15, 27). The results presented here suggest that the *nos* morphogen activates *kni* gene expression indirectly by repressing inappropriate *hb* expression in the posterior half of the body. The *hb* protein may therefore directly repress transcription of the *kni* gene. Thus, the *bcd* and *nos* morphogens may specify the subdivision of the body into distinct anterior (*hb-on*; *kni-off*) and posterior (*hb-off*; *kni-on*) patterning domains by their immediate effects on the pattern of *hb* expression, the activation of *kni* resulting by default from the absence of *hb* protein.

(3) Role of maternal *hb* expression. The present results show that maternal transcripts of the *hb* gene are not simply dispensable in normal development<sup>13</sup>—they are potentially deleterious. Indeed, failure to remove these unwanted transcripts from the back half of the embryo prevents abdominal differentiation. This peculiar situation may reflect an atavistic quirk in insect evolution. Many primitive insects initially develop only head and thoracic segments, the remaining abdominal segments arising later from a proliferative budding zone<sup>28</sup>. Such short germ-band embryos might well express maternally derived products of a *hb*-like gene throughout the early embryo. In contrast, more highly evolved, long germ-band insects like *Drosophila* need to eliminate posterior expression of such *hb* gene products in order to lay down the entire body plan (including all of the abdominal segments) at the blastoderm stage. The *nos* morphogen system may therefore have evolved specifically as a mechanism for allowing this more rapid mode of development.

(4) Control of posterior body pattern. The discovery that embryos lacking the posterior determinant system can develop normally under certain conditions establishes that the *nos* morphogen is not directly responsible for organizing posterior

FIG. 2 Cuticular phenotypes of larvae derived from wild-type heat shocked *hsp70-hb* and *vasa* embryos. Dark-field micrographs showing the ventral aspects of larvae derived from wild-type embryos (a), heat shocked *hsp70-hb* embryos (b and c) and *vasa*<sup>PD</sup> mutant embryos (d) (larvae in a and b show only the ventral aspect; larvae in c and d show superimposed ventral and dorsal aspects; all embryos are oriented with their heads at the top). Wild-type larvae differentiate eight abdominal segments which are associated with distinctive patterns of thick ventral hairs (dentical bands). These are preceded anteriorly by three thoracic segments associated with bands of fine ventral hairs and the head which includes prominent derivatives of the mouthpart segments, and followed posteriorly by terminal structures including the paired spiracles. *hsp70-hb* embryos heat-shocked approximately 105–165 min after fertilization give rise to larvae which have normal heads and anterior thoracic segments but lack most or all of the abdominal segments as shown in b and c. (Single collections of heat shocked embryos were split into two populations, one assayed for eve protein expression 60 minutes after heat shock, the other analysed for cuticular pattern following differentiation. Of the embryos which differentiate larval cuticle, more than 50 per cent show segmental patterns which range between the embryos shown in b and c; larvae showing wild-type cuticular patterns almost certainly developed

from embryos heat shocked towards the end of the blastoderm stage or later (which show normal patterns of eve expression.) In larvae lacking all abdominal segments, the third thoracic segment is often partially deleted and the posterior spiracles are rudimentary and fail to pair, as shown in c. These larvae closely resemble larvae derived from *vasa* mutant embryos (d) which generally lack all of the abdominal segments, show partial deletions

of the third thoracic segment and have unpaired, rudimentary spiracles.

**METHODS.** Unhatched larvae were dechorionated with commercial bleach, transferred to a mixture of 1:1 heptane:methanol and vortexed until most were separated from the vitelline membrane. They were then rinsed in 0.1% Triton-X and mounted in a mixture of 1:1 Hoyer's mountant:lactic acid<sup>33</sup>.

**FIG. 3** Induction of homozygous *hb* clones in the germ lines of females lacking the posterior determinant system. Female first and second instar larvae of the genotype *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>/+* were irradiated with 1,000 rad to induce mitotic recombination in single germ cells as shown at the top. The *Kinked* (*Ki*) mutation is a dominant bristle marker which is positioned just proximal to the *hb* mutation on the right arm of chromosome 3 (ref. 34). Recombination between the *Ki* locus and the centromere will result in a homozygous *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>* daughter cell, provided that chromatids 1 and 3 segregate together (the *Ki* and *hb* loci are tightly linked; hence, few if any recombination events are expected to occur between them). The descendants of this cell will form a germ-line clone giving rise to eggs lacking functional maternal transcripts of the *hb* gene. The other daughter cell will be homozygous for the wild-type *Ki* and *hb* alleles and, like the surrounding *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>/+* cells, will give rise to eggs with ubiquitous, functional *hb* transcripts. Fertilization of *vas* eggs containing functional *hb* transcripts should generate phenotypically mutant embryos because the *vas* mutation prevents activity of the posterior determinant *nos*, thereby allowing the maternal *hb* transcripts (hatching) to persist and give rise to inappropriate posterior expression of the *hb* protein, as shown. Conversely, removing the wild-type allele of *hb* from the germ line via mitotic recombination should abolish this inappropriate posterior expression, whereas zygotic activation of the paternal *hb* gene (opposite hatching) under the control of the *bcd* gradient should suffice to generate the necessary anterior domain of *hb* expression. Note that the *vas<sup>PD</sup>* mutation also prevents the formation of posterior polar granules associated with localized germ-cell determinants; consequently all of the progeny from *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>/+* females are agametic, irrespective of the presence or absence of functional maternal *hb* transcripts. Note also that virtually all larvae derived from these females show a less extreme mutant phenotype than that observed in larvae derived from *vas<sup>PD</sup>/vas<sup>PD</sup>* mothers which carry two functional copies of the *hb* gene. In particular, they generally form a single band of abdominal denticles between the thorax and posterior terminalia in contrast to standard *vas<sup>PD</sup>* mutant embryos (for example, Fig. 2d) which do so only occasionally. This slight degree of phenotypic rescue probably results directly from the lower maternal *hb* gene dosage in *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>/+* females, as completely eliminating the maternal *hb* contribution, as described below, fully rescues abdominal segmentation, as shown. Approximately 800 female flies obtained from irradiated *vas<sup>PD</sup>/vas<sup>PD</sup>; Ki hb<sup>14F</sup>/+* larvae were outcrossed in small groups of 10–20 flies to wild-type males. Of the 70 such group matings which were performed, 24 gave rise to small numbers of wild-type larvae which developed in adult flies with normal abdominal patterns; all the rest produced only *vas* mutant larvae (nine of these 24 matings gave rise to single surviving flies, six gave rise to 2–3 survivors, and eight gave rise to four or more survivors). A total of 71 such adult flies were obtained: all were phenotypically *Ki* as was to be expected if they arose from mitotic recombination. In addition, all of the flies which survived

long enough to be tested (55/71) were sterile, and in fact agametic, as was to be expected if they arose from *vas* mutant eggs. Finally, in two cases it was possible to identify the single female fly generating phenotypically wild-type larvae; in both cases, all but the few surviving progeny developed as *vas* mutant larvae. The phenotypic properties of the surviving flies therefore establish that these progeny arose from homozygous *Ki hb<sup>14F</sup>/Ki hb<sup>14F</sup>* clones in the germ lines of their homozygous *vas<sup>PD</sup>/vas<sup>PD</sup>* mothers. **METHODS.** Surviving flies were tested for fertility by outcrossing them singly to flies of the opposite sex for 5–7 days. Their ovaries or testes were then removed and examined under phase and Nomarski optics for the presence of germ cells. The frequency of clones obtained (~1 clone per 25 flies) is similar to that obtained in other studies (see for example, ref. 24); given that 24/70 group matings produced surviving adults, it is likely that more than one female contained a clone in some of these matings.

pattern. Instead, activity of the *nos* morphogen appears only to define the region in which abdominal segmentation will occur. Other spatial determinants must therefore be responsible for organizing pattern within this domain. One possibility is that the overlapping distributions of the products of the gap genes *kruppel*, *kni* and *tailless*<sup>6,12,16,27</sup> provide a series of short-range

gradients which govern the subdivision of the posterior half of the embryo into particular abdominal segments. This strategy of controlling body pattern would differ significantly from the strategy operating in the anterior half of the embryo where the graded distribution of a single molecular species, *bcd*, provides a coherent system of cues organizing the global pattern. □

# Detectability of gravitational microlensing in the quasar QSO2237+0305

Rainer Kayser\* & Sjur Refsdal†

\* Canadian Institute for Theoretical Astrophysics, 60 St George Street, Toronto, Ontario M5S 1A1, Canada

† Hamburger Sternwarte, Gojenbergsweg 112, D-2050 Hamburg 80, FRG

THE quasar QSO2237+0305 is unique in being located almost exactly behind the centre of a bright nearby galaxy, of magnitude 14.5 and redshift 0.039 (ref. 1). Recent observations<sup>2-4</sup> show that the quasar is split into four images with very similar spectra, strongly suggesting gravitational lensing by the foreground galaxy. We show here that compact objects within the galaxy, such as stars, lying near the line of sight, can cause transient microlensing effects. Rapid changes owing to transverse motions of quasar, galaxy and observer turn out to be more likely in QSO2237+0305 than in any other system. The time delays between the four macro-images are about a day or less<sup>3</sup>, so intrinsic variations should show up 'simultaneously' in all images, and a change in observed luminosity ratios would be direct proof of microlensing. QSO2237+0305 is the only known system where such unequivocal proof is possible, making it a key object in assessing the general importance of microlensing.

Theoretical models<sup>3,5</sup> that assume a smooth distribution of matter in the foreground galaxy fit the observations fairly well, and we have developed a method whereby microlensing effects from compact objects near the line of sight can be estimated from the macrolensing model. For reasonable choices of system parameters and a quasar radius  $R_q < 0.05 (M/M_\odot)^{1/2}$  pc, where  $M$  is the mass of the object causing microlensing, we expect changes larger than  $0.05 (M/M_\odot)^{1/2}$  mag per year in at least one of the images. For  $R_q < 0.005 (M/M_\odot)^{1/2}$  pc, high-amplification events should occur about once every three years in one of the images, and would lead to a microlensing amplification of more than a factor of two on a timescale of one year or less.

Microlensing by stars close to the light path has been discussed intensively over the past decade<sup>6-13</sup>. It is possible that gravitational lensing, and particularly microlensing, is affecting a large fraction of the distant quasars. If so, our concepts of quasar structure, quasar evolution, quasar statistics, and mass distribution in the Universe (abundance of compact masses between  $10^{-3} M_\odot$  and  $10^3 M_\odot$ ) must clearly be revised. From the observational point of view there are some indications of variability arising from microlensing (ref. 14, C. Vanderriest *et al.*, preprint, and R. E. Schild, personal communication), but there is no firm evidence at present. To assess the general importance of microlensing, the most promising systems for such effects should be investigated first. These systems are the gravitationally lensed quasars with several macro-images, for which enough mass is 'between' the images<sup>15</sup> that a large optical depth for microlensing ( $\tau$ ) usually results. Typically one finds a  $\tau$  larger than  $0.5 \epsilon$  in some of the images, where  $\epsilon$  is the fraction of the deflector mass that is in stars. Furthermore, the discrimination between intrinsic and microlensing variability is much simpler in such systems.

Among the lensed quasars with several macro-images the quadruple QSO2237+0305 (refs 2, 3) is the most promising system, because the deflector is about ten times closer than in other known systems. Therefore the Einstein radius  $\zeta_0$  of a single star with mass  $M$  in the deflecting galaxy, projected into the source plane, is (with redshift of the deflector  $z_d = 0.039$ , redshift of the quasar  $z_q = 1.7$ , Hubble constant  $H_0 = 75 \text{ km s}^{-1} \text{ Mpc}^{-1}$  and cosmological deceleration parameter  $q_0 = 0$ )

$$\zeta_0 \approx 0.05 \sqrt{M/M_\odot} \text{ pc} \quad (1)$$

which is about three times larger than for other known lens systems. As smearing effects strongly reduce the effect of microlensing when the quasar radius  $R_q$  is larger than  $\zeta_0$ , such effects are much less probable for QSO2237+0305. Also favourable is the fact that we expect a much larger transverse velocity  $V$  between the (anti-)caustics and the source because of the large distance ratio ( $D_q/D_d \approx 11$ ). We find that

$$V = \frac{v_q}{(1+z_q)} - \frac{D_q}{D_d} \frac{v_d}{(1+z_d)} + \frac{D_{dq}}{D_d} \frac{v_{\text{obs}}}{(1+z_d)} \quad (2)$$

where  $D_d$ ,  $D_q$  and  $D_{dq}$  are apparent size distances and  $v_d$ ,  $v_q$  and  $v_{\text{obs}}$  are the transverse velocities involved. With  $v_d$  and  $v_{\text{obs}} \approx 400 \text{ km s}^{-1}$  we expect  $V \approx 6,000 \text{ km s}^{-1}$ , which is about a factor of 10 larger than for other known systems. This results in a reduced characteristic timescale for microlensing of

$$\Delta t_0 = \zeta_0/V \approx 8 \sqrt{M/M_\odot} \frac{6,000 \text{ km s}^{-1}}{V} \text{ yr} \quad (3)$$

and more rapid changes in the observed luminosity of individual images. For  $R_q \leq 0.1 \zeta_0$ , that is,  $R_q < 0.005 \sqrt{M/M_\odot} \text{ pc}$ , a pronounced asymmetric peak in the light curve occurs when the source crosses a (micro-) caustic. For such high-amplification events (HAEs) we expect a maximum amplification owing to microlensing of

$$A_{\text{max}} \approx \sqrt{\zeta_0/R_q} \approx 2.5 (M/M_\odot)^{1/4} (0.005 \text{ pc}/R_q)^{1/2} \quad (4)$$

on a timescale of

$$\Delta t_h = R_q/V \approx (R_q/0.005 \text{ pc})(6,000 \text{ km s}^{-1}/V) \text{ yr} \quad (5)$$

With macro-lens modelling (homogeneous deflector) it is possible to determine the projected surface mass density  $\sigma_i$  and the shear parameter  $\gamma'$  at all image positions. To estimate microlensing effects, however, we need to know the normalized surface density  $\sigma$  in stars<sup>10,11</sup> or equivalently the optical depth  $\tau$  for microlensing<sup>16</sup>,

$$\sigma = \frac{\sigma_s}{1 - \sigma_c} = \tau \quad (6)$$

and the normalized shear parameter<sup>11</sup>

$$\gamma = \frac{\gamma'}{1 - \sigma_c} \quad (7)$$

Here  $\sigma_s$  is the projected smoothed-out surface mass density in stars, and  $\sigma_c$  is the projected continuous surface mass density, both in units of the critical surface mass density  $\sigma_0$ :

$$\sigma_0 = \frac{c^2}{4\pi G} \frac{D_q}{D_d D_{dq}} \quad (8)$$

With these parameters we can write the lens equation, which defines the mapping from the deflector plane onto the observer (or source) plane, in the normalized form (see ref. 11 for a more detailed discussion)

$$\zeta = \text{sign}(\sigma) S(z) + \begin{pmatrix} 1+\gamma & 0 \\ 0 & 1-\gamma \end{pmatrix} z \quad (9)$$

where the first term represents the effect of stars close to the light path and the second term represents the large-scale field of the deflector as a whole. Note that the length unit in the source plane is now the projected Einstein radius (compare equations (1)). If the stars had been smeared out, the amplification of one macro-image would have been

$$A_G = |(1 - \sigma_c)^2 (1 - \sigma + \gamma)(1 - \sigma - \gamma)|^{-1} \quad (10)$$

Assuming a fraction  $\epsilon$  of the mass to be contained in stars ( $\sigma_s = \epsilon \sigma_i = \epsilon (\sigma_s + \sigma_c)$ ) we can calculate  $\sigma$  and  $\gamma$  from equations (6) and (7) if  $\sigma_i$  and  $\gamma'$  are known. By eliminating  $\epsilon$ , we find a simple relation between  $\sigma$  and  $\gamma$ :

TABLE 1 Assumed values for  $\sigma_i$  and  $\gamma'$  for the four images

	A	B	C	D
$\sigma_i$	0.36	0.45	0.88	0.61
$\gamma'$	0.44	0.28	0.55	0.66

$$\sigma = 1 + \frac{\sigma_i - 1}{\gamma'} \gamma \quad (11)$$

For a given macro-image (given  $\sigma_i$ ,  $\gamma'$ ), this represents a straight line in the  $(\sigma, \gamma)$  diagram.

Theoretical macrolensing models of QSO2237+0305 which agree well with the observations have been presented recently by several groups<sup>3,5</sup>. The quantities  $Amp_{cal}$  and  $\tau_{lens}$  used in ref. 3 correspond to  $A_G$  and  $\sigma$  used in this paper (compare equation (10) and ref. 11). It is now a simple task to determine  $\gamma'$  (and  $\sigma_i$ ) for all four images, and the values are given in Table 1. We have here made use of the fact that images C and D have negative parities ( $\sigma_i + |\gamma'| > 1$ ) and that images A and B therefore must have positive parities. Note that the above discussion uses differently orientated coordinate systems for all four images.

The determination of  $\sigma_i$  and  $\gamma'$  is not possible from the data given in ref. 5 because  $\tau_{lens}$  is not given; because of the similarity of the solutions, however, we expect similar parameter values. Our test calculations also indicate that the parameter values based on ref. 3 are reasonably accurate, and we therefore adopt the values given in Table 1.

In Fig. 1 the corresponding  $\sigma(\gamma)$  relations (compare equation (11)) are shown for all images, with  $\epsilon$  values indicated for some

selected points. All the straight lines go through the point  $\sigma = 1$ ,  $\gamma = 0$ ; note, however, that only the solid parts of the lines correspond to possible models ( $\sigma_c > 0$ , that is,  $\epsilon \leq 1$ ). Also shown in Fig. 1 are models, with equal masses in all stars, for which light curves have been presented in ref. 11. Three of these models ( $\sigma, \gamma$ ) = (0.1, -0.6), (0.4, -0.4) and (0.1, -1.4), which were denoted A3, A4 and B1 respectively in ref. 11—are of particular interest here as they are very close to possible microlensing models of one of the images. The two models with  $\sigma = 0.1$  should yield a reliable lower limit to microlensing variability of images A, B and D, because their  $\epsilon$  values (0.17 and 0.08) are smaller than expected in reality, and the variability increases with increasing  $\epsilon$  for a given  $\sigma_i$  and  $\gamma'$ . This lower limit should also apply for image C, as it has a much larger  $\sigma$  than the other images for the same  $\epsilon$ .

From the 'normalized' light curve of the two  $\sigma = 0.1$  models presented in ref. 11, we find, for about 50% of the time, a rate of change larger than 0.2 mag per normalized unit  $\zeta_0$  for all source sizes calculated, that is, for  $R_q$  equal to 0.011  $\zeta_0$ , 0.1  $\zeta_0$  and 0.9  $\zeta_0$  respectively. For about 30% of the time the rate of

change is even larger than 0.4 mag per normalized unit. For  $R_q > \zeta_0$  it is clear, however, that such rapid variations occur much less frequently with increasing  $R_q$ .

To obtain time-dependent light curves we need to know the time  $\Delta t_0$  taken to move transversely by one normalized length unit. We use the estimate given in equation (3) (note that a relatively small  $\sigma_c$  ( $\sim 0.3$ ) has been assumed; compare Table 3 in ref. 11), and we find that two macro-images are expected to vary at a rate greater than  $0.025 \sqrt{M_\odot/M}$  ( $V/6,000 \text{ km s}^{-1}$ ) magnitudes per year, and one of them at a rate greater than  $0.05 \sqrt{M_\odot/M}$  ( $V/6,000 \text{ km s}^{-1}$ ) magnitudes per year if  $R_q$  is smaller than  $0.05 \sqrt{M/M_\odot}$  pc. Such independent variations in the four images should not be difficult to demonstrate, because they would lead to variations of the observed luminosity ratios. This would be a proof of microlensing because intrinsic variations would show up 'simultaneously' in the four images as a result of the small time delay (about one day or even less<sup>3</sup>), and could not lead to variations in the observed luminosity ratios. Note that QSO2237+0305 is the only known system that offers the possibility of such an unequivocal proof.

From the simulated light curves in ref. 11 we estimate the frequency of high-amplification events to be  $N_{HAE} \approx 0.3 \sqrt{M_\odot/M}$  ( $V/6,000 \text{ km s}^{-1}$ ) per year in one of the images. Accurate observations of the luminosity during an HAE can give valuable information on the structure and size of the source<sup>13</sup>. QSO2237+0305 is the most promising object for such an investigation, because 1) smearing effects are less probable than in other systems, 2)  $N_{HAE}$  is larger and 3) intrinsic variability and microlensing can easily be separated in this system. Regular monitoring of QSO2237+0305 (on the order of once a week) should therefore be given high priority.  $\square$

## Stratospheric nitric acid vapour measurements in the cold Arctic vortex: implications for nitric acid condensation

F. Arnold & G. Knop

Max-Planck-Institut für Kernphysik, Postfach 103980,  
D-6900 Heidelberg, FRG

STRATOSPHERIC nitric acid condensation has recently been proposed<sup>1,2</sup> to take place in the cold winter polar vortex, priming it for chlorine-catalysed ozone destruction. This idea has been developed subsequently<sup>3–8</sup>. Condensation, thought to proceed via a heterogeneous heteromolecular mechanism involving stratospheric water vapour and pre-existing  $\text{H}_2\text{SO}_4/\text{H}_2\text{O}$  aerosols, which serve as condensation nuclei, leads to solid nitric acid trihydrate.

(NAT;  $\text{HNO}_3 \cdot 3\text{H}_2\text{O}$ ) aerosols. It is expected<sup>1,2,8</sup> that the condensation temperature,  $T_c(\text{NAT})$ , is significantly greater than that of water-ice,  $T_c(\text{H}_2\text{O-ice})$ , given the stratospheric abundances of gaseous nitric acid and water and the thermodynamic properties of stratospheric aerosols<sup>8</sup>. Knowledge of  $T_c(\text{NAT})$  is important because it determines the spatial and temporal extent of NAT aerosols and hence possibly of polar ozone destruction. Here we report *in situ* measurements of the detailed height distribution of gaseous nitric acid in the cold arctic vortex, using a balloon-borne technique<sup>9-16</sup>, which offers a much better altitude resolution (30 m) than previous satellite measurements<sup>17,18</sup>. Our data set an upper limit to  $T_c(\text{NAT})$  of 195 K at 23 km, and are consistent with model predictions based on the present gaseous nitric acid data, typical water vapour abundances and thermodynamic data<sup>8</sup> of macroscopic NAT mixtures. However, our upper limit to  $T_c(\text{NAT})$  is markedly lower than some of the early model estimates<sup>1,2</sup>.

The ACIMS instrument used for these measurements has been described previously<sup>9-16</sup>. The present limit for gaseous nitric acid detection is about  $1 \times 10^7$   $\text{HNO}_3$  molecules per  $\text{cm}^3$ , far lower than typical stratospheric nitric acid concentrations at heights below 30 km ( $>1 \times 10^9 \text{ cm}^{-3}$ ). The accuracy of the gaseous nitric acid concentrations measured here is  $\pm 50\%$  and the precision is  $\pm 20\%$ . An important aspect of the experiment is the possibility of perturbation of the nitric acid measurements by NAT aerosols, which may evaporate inside the flow tube of our instrument. Careful simulation and atmospheric test measurements<sup>16</sup>, including also aircraft flights in the lower stratosphere, have shown that significant evaporation of stratospheric  $\text{H}_2\text{SO}_4/\text{H}_2\text{O}$  aerosols can be induced only by massive additional heating of the gas stream. In our present measurements, however, the gas temperature inside the flow tube exceeds the ambient gas temperature by not more than a few degrees, therefore ruling out extensive NAT aerosol evaporation. The measurements reported here were part of the CHEOPS 2 expedition, which took place in January-February 1988 in the Arctic, mainly at Esrange, about 50 km east of Kiruna in Northern Sweden. During this expedition we carried out three balloon flights. One of these (B-88-2; 1 February 1988) was performed under conditions of particularly low stratospheric temperature and the results of just this flight are reported here. The balloon reached a maximum altitude of 31 km and ACIMS measurements were made on ascent between 13 and 31 km and on descent between 31 km and 5 km.

Figure 1 shows the time evolution of stratospheric temperatures in the core of the polar vortex and over Esrange at the 30 hPa pressure level. The height distribution of the temperature, measured by a sensor mounted 5 m above the balloon gondola, is depicted in Fig. 2. The accuracy of the temperature measurement is about  $\pm 0.3$  K. The coldest layers (193 K) were found around 23 km and 26 km. The measured height distribution of nitric acid vapour is given in Fig. 3a along with previous satellite data. Our data, with a resolution of 30 m, are generally consistent with satellite infrared measurements, which offer an altitude resolution of only 3,000–5,000 m. Our data are somewhat higher than previous model predictions<sup>19,20</sup> based only on gas-phase chemistry (also shown in Fig. 3a). Our total vertical column nitric acid density of  $1.5 \times 10^{16} \text{ cm}^{-2}$  is consistent with previous ground-based column measurements performed with infrared techniques<sup>21-23</sup> in the winter polar vortex. Figure 3b shows a portion of the nitric acid profile (around 23 km) with the maximum possible altitude resolution. Interestingly, no pronounced local minimum is seen at the heights where the lowest temperatures occurred. Some fine structure is observed, which may also be due to transport effects. We conclude from our data that  $T_c(\text{NAT})$  must have been equal to or lower than 195 K. If the temperature falls below  $T_c(\text{NAT})$  by only 2 K one may expect<sup>8</sup> gaseous nitric acid to become depleted by about a factor of four. We cannot exclude the possibility that some nitric acid condensation had already taken place, but we can be sure that  $T_c(\text{NAT})$  is no more than 2 K greater than the measured  $T$ .

Three days before our balloon flight, a search for stratospheric layers with enhanced aerosol backscattering was carried out by Poole *et al.*<sup>24</sup> using an aircraft-borne lidar (laser radar) (Fig. 1). On this flight, enhanced lidar-backscattering was observed only close to the centre of the vortex between Spitsbergen and Greenland, where the lowest temperature around 23 km was  $\sim 190$  K. The observed excess aerosol layer was located around 23 km and was very thin (300 m).

Using the nitric acid measurements, we may estimate the height variation of  $T_c(\text{NAT})$ , on the basis of laboratory measurements<sup>8</sup> of macroscopic NAT mixtures and taking for the stratospheric abundance of water vapour a typical value of 5 p.p.m.v. (as measured by satellite-borne remote-sensing techniques<sup>25</sup> in the winter Arctic vortex around 20 km altitude). The resulting

FIG. 1 Time evolution of stratospheric temperatures in the Arctic during winter and early spring of 1988. Condensation temperatures at 30 hPa for pure  $\text{H}_2\text{O-ice}$  and NAT are indicated. Also marked are dates of our balloon flight B88-2 and the NASA aircraft flight. See text for details. The Arctic temperatures were provided by the Meteorological Institute of the Free University of Berlin (K. Labitzke *et al.*, personal communication).

FIG. 2 Temperature profile measured on our balloon flight B88-2. For comparison we also show the US Standard Atmosphere zonally averaged temperatures for  $75^\circ\text{N}$  in December during cold conditions, and ranges for minimum temperatures measured in January and February over northern Sweden in 1982, 1983 and 1984 (horizontal bars). Also shown are model profiles for condensation temperatures for the NAT and  $\text{H}_2\text{O-ice}$  systems, calculated using our measured nitric acid abundance and a typical water vapour abundance of 5 p.p.m.v. (dashed curves).

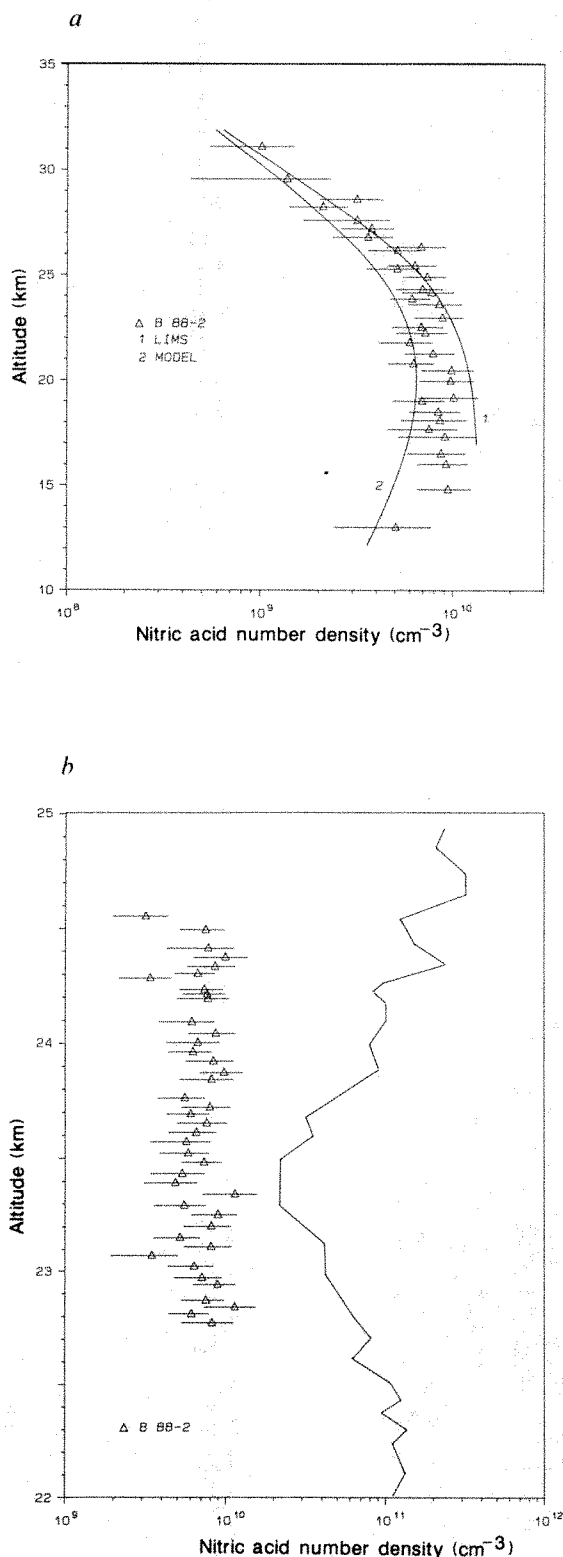

FIG. 3 *a*, Altitude distribution of concentrations of gaseous nitric acid measured by ACIMS on flight B88-2 (1 February 1988) in the cold Arctic winter vortex (the altitude is a geometric altitude measured by radar). For comparison, zonally averaged LIMS data<sup>9,10</sup> for December at 70° N are also given (curve 1). Comparison is also made with theoretical model calculations<sup>19,20</sup> for December at 70° N (in which heterogeneous formation of HNO<sub>3</sub> is neglected) (curve 2). *b*, Portion of the measured gaseous HNO<sub>3</sub> concentration profile shown in *a* but reprocessed to give the maximum possible height resolution. For comparison, model equilibrium saturation concentrations for HNO<sub>3</sub> over NAT are also shown, assuming a typical H<sub>2</sub>O vapour mixing ratio of 5 p.p.m.v. and using the measured atmospheric temperature profile (B88-2).

height distribution of  $T_c(\text{NAT})$  is shown in Fig. 2, along with  $T_c(\text{H}_2\text{O-ice})$ . We note, however, that water vapour abundance is a critical factor. Assuming a water vapour abundance of only 2.5 p.p.m.v.,  $T_c(\text{NAT})$  becomes lower by about 3 K; with a value of 7.5 p.p.m.v.,  $T_c(\text{NAT})$  increases by  $\sim 1$  K (ref. 8). Hence, local and temporal variations of water vapour would probably induce large local and temporal variations in  $T_c(\text{NAT})$  (of up to 4 K). Therefore, the  $T_c$  values for both NAT and pure water-ice (shown in Fig. 2) probably represent only approximate figures. The general decrease of  $T_c(\text{NAT})$  with increasing altitude is due to the decrease in concentrations of both HNO<sub>3</sub> and H<sub>2</sub>O. The steeper decrease above  $\sim 25$  km reflects the steep decrease of the HNO<sub>3</sub> concentration at these heights. The smaller gradient of the  $T_c(\text{NAT})$  curve below 15 km reflects the decrease in nitric acid concentration with decreasing height. The  $T_c(\text{NAT})$  curve becomes locally similar to our measured temperature profile at altitudes between  $\sim 18$  and 23 km, with  $\Delta T = T - T_c(\text{NAT})$  becoming locally as small as  $\sim 2$  K at around 23 and 20 km. Figure 2 also shows that zonally averaged temperatures<sup>26</sup> in December at a latitude of 75° N are markedly higher than  $T_c(\text{NAT})$ . However, minimum temperatures (shown in Fig. 2 for selected pressure levels) measured at the radiosonde station of Sodankylä (230 km east of Esrange) in January and February of 1982, 1983 and 1984 become distinctly lower than  $T_c(\text{NAT})$  at altitudes between about 17 km and 24 km and around 13 km. Around the latter height, minimum temperatures become even slightly lower than  $T_c(\text{H}_2\text{O-ice})$ . Hence, conditions for NAT aerosol formation seems to be favourable in two layers, at 17–24 km and  $\sim 13$  km, whereas H<sub>2</sub>O-ice aerosol formation seems to be possible only in the lower layer. It must be kept in mind, however, that these conclusions refer to only a single station (Sodankylä) and a period of only three years (1982, 1983 and 1984). The values of  $T_c(\text{NAT})$  and  $T_c(\text{H}_2\text{O-ice})$  at 23 km are shown in Fig. 1. Evidently, at the core of the vortex  $T$  became markedly lower than  $T_c(\text{NAT})$  from day 16 to day 64 (a period of seven weeks). In contrast, at Esrange  $T$  became lower than  $T_c(\text{NAT})$  at the 30 hPa-pressure level only during a single short period from around day 47 to day 51. With a model  $T_c(\text{NAT})$  value of 193 K at the 30-hPa level, the area where NAT aerosol formation may have occurred on 1 February 1988 is relatively large, approximately the size of Greenland.

In conclusion, it seems that the upper limit to  $T_c(\text{NAT})$  set by our present data is consistent with model predictions based on our nitric acid measurements, recent laboratory data<sup>8</sup> on macroscopic NAT mixtures and typical stratospheric abundances for water. The low  $T_c$  values mean that NAT aerosol formation may occur in the 'core' region of Arctic vortex but seems to be rare in outer regions of the vortex, at the latitude of Kiruna for example. Hence, the spatial and temporal distribution of NAT aerosol in the Arctic seems to be rather limited in extent compared with the Antarctic stratosphere, where average winter temperatures are about 5–10 K lower. However, lower temperatures may also reduce the probability of NAT formation by inducing heterogeneous condensation of 'pure' water vapour on NAT aerosols followed by rapid gravitational settling of relatively large water-ice particles containing NAT cores. Both nitric acid and water may thereby become depleted in the coldest layer, which would reduce the probability of subsequent NAT aerosol formation at these heights. Besides the larger dynamical activity, the higher temperatures of the Arctic vortex may therefore be a major reason for the absence of pronounced ozone depletion in the Arctic. However, a cooling of the winter polar Arctic vortex by only a few degrees may be sufficient to make NAT aerosol formation much more widespread in the Arctic. Such a cooling could be induced in the future by the rising content of CO<sub>2</sub> and other infrared active gases in the atmosphere, which cools the stratosphere by emission of infrared radiation. Recent climate models<sup>27</sup> predict a cooling of the Arctic vortex in winter by up to  $\sim 6$  K. Changes of the stratospheric water vapour abundance, which could result from changes of tropical

tropopause temperatures associated with a troposphere greenhouse effect, would also be important. □

**ACKNOWLEDGEMENTS.** The authors are grateful to the many colleagues who participated in the CHEOPS expeditions and contributed to the success of this project. In particular, we acknowledge support from Esrange, CNES and DFLR, and the collaboration with KFA Jülich, DFLR, NASA. We are grateful to the team of the Meteorological Institute of the Free University of Berlin, especially K. Labitzke, K. Paetzold, B. Naujokat and R. Lenchow, who provided us with essential information and predictions on stratospheric meteorology. We also thank the technical staff of the MPIK, particularly K. Bechberger, W. Dann, B. Preissler, H. Sauer and W. Thron. This project was funded by the BMFT through GSF.

## Increased particle flux to the deep ocean related to monsoons

**MONSOONS** cause seasonal reversals in the surface circulation of the northern Indian Ocean<sup>1</sup>. In the Arabian Sea this results in the upwelling of nutrient-rich water along the coasts<sup>2-4</sup>, making it one of the highly productive regions of the world's oceans. To assess the impact of monsoon-driven processes on the downward particle flux variations in the open ocean we deployed three moored arrays consisting of six time-series sediment traps at selected locations in the western, central and eastern parts of the deep northern Arabian Sea. Strong seasonality was recorded in particle flux at all three sites with peaks during the south-west and north-east monsoons. High primary productivity during the monsoons resulting from wind-induced mixed-layer deepening and the associated nutrient injection to the euphotic zone appeared to be the main factor controlling the observed particle flux pattern. These findings may shed light on CO<sub>2</sub> uptake during glaciation when wind speeds were higher.

Three mooring systems, each consisting of two time-series sediment traps—one 1,000 m below the sea surface and the other 1,000 m above the sea bottom—were deployed at three

sites in the western, central and eastern Arabian Sea (Fig. 1). The collecting cups were poisoned with mercuric chloride before deployment. The sediment traps were programmed to measure the flux of sinking particles at intervals of 12 to 13 days each over a duration of six months per deployment. They have been recovered and redeployed three times since May 1986 using the research vessels RV *Sonne* and the ORV *Sagar Kanya*. Here we report the results obtained during the first year of deployment.

On recovery of the traps, the samples were wet-sieved and split using a precision rotary splitter. One quarter of the <1 mm size fraction was filtered through pre-weighed Nuclepore filters (0.5 µm) and dried at 40 °C. This fraction was used for flux calculations and for analysis of first order parameters such as carbonate, opal, lithogenic, organic carbon, and nitrogen<sup>6,7</sup>.

At all three sites the flux of sinking particles showed seasonality which is strongly related to the monsoons with higher fluxes during the south-west (June to September) and north-east (December to February) monsoons (Fig. 2). Individual fluxes differed by more than two orders of magnitude. Differences between maximum and minimum fluxes during these two periods were highest at the western and eastern sites; these are characterized by their proximity to the upwelling centres along the Somali and the Arabian coasts and the Indian continental shelf, respectively. The similarity in flux patterns not only at sites close to the upwelling centres, but also at the site in the central Arabian sea, indicates that factors other than coastal upwelling might also be responsible for the higher particle fluxes. The close relationship observed between particle fluxes and wind speeds at the three sites provides a clue (Fig. 3). Higher wind speeds lead to a deepening of the mixed layer and the introduction of nutrient-rich subsurface waters into the euphotic zone<sup>8,9</sup>. Mixed-layer deepening from 30 to 40 m during the pre-monsoon period to more than 100 m during the south-west monsoon have been reported<sup>10</sup>. The wind-induced nutrient pumping into the euphotic zone is especially effective in the Arabian Sea as subsurface waters are extremely rich in nutrients<sup>11</sup>. This results in high primary production during both monsoons<sup>12-14</sup> and this high 'new production' is reflected in high particle fluxes to the deep sea. An exception to this is the eastern Arabian Sea during the north-east monsoon. Here particle fluxes are extremely low, although wind speeds are only slightly lower than at the other stations. This could be due to the absence of regular winter blooms caused by the inflow of low-salinity water from the eastern tropical Indian Ocean, which leads to stronger stratification and to lower productivity<sup>13</sup>.

FIG. 1 Locations of mooring systems in the western, central and eastern Arabian Sea. The distance of the moorings from the nearest coast are 520, 930 and 430 km for the eastern, central and western trap, respectively.

FIG. 2 Seasonal variations of particle fluxes to the deep Arabian Sea (bottom) from time-series sediment trap deployments (sampling intervals 12–13 days) at the western, central and eastern Arabian Sea (trap depths: 3,020 m, 2,900 m and 2,770 m, respectively), and wind-speed data during the period of deployment (top) compiled from ship observations (Indian Daily Weather Report, Pune, India) within a radius of  $2^\circ$  around the three sediment trap locations. Wind-speed data were smoothed with a 5-point moving average. Peak fluxes occurring during the SW (June–September) and NE (December–February) monsoons show close similarity to wind-speed patterns and are related to high primary production resulting from wind-induced mixed layer deepening and associated nutrient injection in the euphotic zone<sup>8,9</sup>, and is best established in the central Arabian Sea (see Fig. 3). The peak fluxes in the western Arabian Sea during July–August and between August–October in the eastern Arabian Sea also have components derived from nutrient advection<sup>16</sup> and lateral transport of material from the coastal

upwelling centres. In the eastern Arabian Sea strong stratification results from the inflow of low-salinity water from the eastern tropical Indian Ocean during the NE monsoon leads to low productivity<sup>13</sup> reflected in low particle fluxes.

Further information on factors controlling the observed fluxes comes from the component fluxes (Table 1). Carbonates dominate the component fluxes and are present mainly in the form of coccolithophorids with a certain amount of foraminifera. Organic carbon and nitrogen fluxes are similar to those reported from other oceanic areas<sup>15</sup>. Major differences between sites were observed in the opal and lithogenic fluxes.

In the central and eastern Arabian Sea sites, opal accounts for 12% and 13% of the total flux. In the western Arabian Sea, opal contributed up to 22% of the total annual flux and accounted for as much as 40% during the peak fluxes in July and August, mostly in the form of the diatom *Rhizosolenia*, a major upwelling species. During the summer monsoon of 1986, waters from the Somali-Arabian upwelling centres have been shown to be advected up to  $60^\circ$  E (ref. 16). Peak fluxes at this site located more than 400 km from the continental margin thus have a component derived from nutrient-rich upwelled water transported offshore.

High lithogenic fluxes are associated with the south-west monsoon (June to September) and their contribution to total fluxes increases from the western (9%) to the eastern (25%)

Arabian Sea site (Table 1). Eolian input to the Arabian Sea is restricted by the Somali Jet to the northwestern parts, and may constitute an important source of lithogenic particles at the western Arabian Sea site (ref. 17; F. Sirocco and M. Sarnthein, manuscript in preparation). In the northeastern and central parts of the Arabian Sea the chief suppliers of lithogenic material are the rivers Indus, Narmada and Tapi. More than 80% of their annual suspended-matter discharge occurs during the south-west monsoon<sup>18</sup>. The simultaneous prevalence of clockwise surface currents in the Arabian Sea can divert lithogenic material to the eastern Arabian Sea, contributing to its relative enrichment. Sediment-trap studies in the outer shelf off Goa, India, have shown Indus-derived sediment to be a significant component during this period<sup>19</sup>.

Our results show that the particle fluxes out of the surface layers in the Arabian Sea are primarily linked to changes in the prevailing meteorological and hydrographical conditions through biological processes occurring in the surface layers. Higher wind speeds promote biological productivity by (1) enhancing the introduction of essential trace elements associated with atmospheric dust fallout (for instance, iron<sup>20</sup>), and (2) the

TABLE 1 Component fluxes of the fraction  $<1$  mm to the deep Arabian Sea. The data are given for the SW (June–September), NE (December–February) monsoons and for the periods in between

FIG. 3 Time-series (sampling intervals 12–13 days) of particle flux from two depths (shallow, 780 m; deep, 2,900 m) in the central Arabian Sea, and the general information on wind velocity<sup>23</sup>, sea-surface temperature<sup>2</sup> and mixed layer depth<sup>1</sup>. Low sea-surface temperatures and a deeper mixed layer during these periods show that wind-induced mixing occurs which brings nutrient-rich water to the surface. The resultant high biological productivity leads to the observed flux pattern.

injection of new nutrients from deeper layers to the euphotic zone. There have been times in the recent geological past when wind speeds were higher than today's by a factor of 1.3 to 1.6, and the atmosphere had higher dust contents, for example during the glacial periods<sup>21</sup>, which must have led to an increase in global ocean productivity. The subsequent removal of this new production to the deep ocean as deduced from our study could have contributed in part to low atmospheric CO<sub>2</sub> contents during the glacial periods<sup>22</sup>. □

ACKNOWLEDGEMENTS. We thank R. Venkatesan, D. Gracias and P. Jöhrendt for technical assistance, and the officers and crew of the research vessels R/V *Sonne* and ORV *Sagar Kanya* for help in the deployment and recovery of the mooring systems. We also thank Dr J. Dymond for his review and comments. Financial support from the Federal German Ministry for Research and Technology, Bonn, and the Council of Scientific and Industrial Research, New Delhi, and the allotment of the ship time on ORV *Sagar Kanya* by the Department of Ocean Development (New Delhi) are gratefully acknowledged.

## Barium content of benthic foraminifera controlled by bottom-water composition

D. Lea & E. Boyle

Department of Earth, Atmospheric and Planetary Sciences, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139, USA

THE carbon isotope ratio ( $\delta^{13}\text{C}$ ) and cadmium content (Cd/Ca) of benthic foraminifera shells have been used to reconstruct deep-water circulation patterns of the glacial oceans<sup>1–7</sup>. These tracers co-vary with phosphorus in the modern ocean because they are nearly quantitatively regenerated from sinking biological debris in the upper water column. Hence they can be used to reconstruct the distribution of labile nutrients in glacial water masses. Independent constraints on glacial deep-ocean circulation patterns could be provided by a tracer of the distribution of silica and alkalinity, the deeply regenerated constituents of planktonic hard parts. Barium shares key aspects of its behaviour with these refractory nutrients because it is removed from solution in surface waters and incorporated into sinking particles which slowly dissolve deep in the water column and in the sediments<sup>8</sup>. The fractionation of Ba between deep-water masses of the major ocean basins is largely controlled by thermohaline circulation patterns, so Ba conforms to different boundary conditions from Cd and  $\delta^{13}\text{C}$ . As Ba substitutes into trigonal carbonates<sup>9</sup>, it is a potential palaeoceanographic tracer if the Ba content of foraminifera shells reflects ambient dissolved Ba concentrations. Here we present data from Recent core-top benthic foraminifera which indicate that the Ba content of some recent calcitic benthic foraminifera does co-vary with bottom-water Ba.

The distribution of barium, alkalinity and silica in the world's oceans was mapped extensively during the GEOSECS

FIG. 1 Paired Ba and alkalinity data from ocean water samples analysed for the GEOSECS program<sup>10–13</sup>. Alkalinity and barium are normalized to a constant salinity of 35‰. Included are: Atlantic Ocean stations 29, 82 and 111 (circles); Pacific Ocean stations 204, 226, 312 and 322 (crosses); and Indian Ocean stations 429 and 452 (diamonds).

program<sup>10-13</sup>. Figure 1 illustrates the similarity between Ba and alkalinity over nine widely spaced GEOSECS sites. Although the cycling of these two tracers is dominated by different mechanisms<sup>14,15</sup>, the overprint of thermohaline circulation on two dissolved constituents sharing similar sites of uptake and regeneration results in strong covariance throughout the world's oceans. Thus the distribution of Ba in glacial oceans can provide direct insight into the distribution of refractory nutrients such as alkalinity.

To calibrate the response of benthic foraminifera shells to ambient Ba concentrations we have measured Ba in foraminifera recovered from Recent core tops lying below bottom waters whose Ba concentrations can be estimated from nearby GEOSECS stations. Foraminifera were hand-picked from disaggregated sediment samples and cleaned with a series of physical and chemical steps designed to remove any extraneous Ba not substituted into the lattice of the foraminiferal  $\text{CaCO}_3$ . These steps begin with the foraminiferal Cd cleaning method<sup>6</sup>, followed by dissolution of associated sedimentary barite ( $\text{BaSO}_4$ ) using alkaline diethylenetriamine-pentaacetic acid (DTPA)<sup>16</sup>. The typical sample mass before cleaning is 0.6 mg (10-30 individuals). Barium concentrations are quantified by isotope-dilution flow-injection analysis on an inductively coupled

plasma-mass spectrometer (ICP-MS). Samples are spiked with  $^{135}\text{Ba}$  and the  $^{135}\text{Ba}/^{138}\text{Ba}$  ratio is measured subsequently. Accuracy is based on calibration of isotope-dilution determinations to a gravimetric standard. The detection limit of the flow-injection method is less than  $0.2 \text{ nmol l}^{-1}$  for a 200- $\mu\text{l}$  injection volume (5 pg Ba). Signal-to-noise ratios of samples were generally greater than 50:1. Calcium is quantified by flame atomic absorption. The inter-run reproducibility for 39 analyses of a consistency standard containing  $9.6 \text{ nmol l}^{-1}$  Ba and  $4.1 \text{ mmol l}^{-1}$  Ca ( $\text{Ba/Ca} = 2.3 \mu\text{mol mol}^{-1}$ ) was 2.6% for Ba, 1.5% for Ca and 3.1% for the Ba/Ca ratio. Although contamination during sample preparation and handling is negligible, occasional individual analyses are unreliable because of insufficient cleaning.

The Ba/Ca ratio of the three species studied (Fig. 2a, b and c; Table 1) increases linearly with increasing concentration in the bottom water. The scatter in the plots exceeds analytical precision and uncertainties in estimating Ba from nearby stations. This scatter may result either from bioturbation, which can mix older individuals (which may have lived at times when bottom-water Ba concentrations were different) into the core top, or from a limit on the reliability of certain species of foraminifera as recorders of ambient Ba concentrations. We

\* Cores with >15 cm Holocene sediment

FIG. 2 Ba/Ca in recent benthic foraminifera plotted against estimated bottom-water barium concentrations. Samples from cores with >15 cm of

Holocene sediment are indicated by darkened symbols. a, *C. wuellerstorfi*; b, *Uvigerina spp.*; c, *C. kullenbergi*.

believe the first factor to be a primary cause of scatter for *C. wuellerstorfi* (Fig. 2a) because the most deviant points (low Ba/Ca ratios for high-Ba Pacific points) are from cores with lower sedimentation rates. Because data for the other two species are more limited, we can not clearly identify the cause of the offsets. Of the three species, *C. wuellerstorfi* shows the least scatter. However, we cannot conclude that this species is necessarily a more reliable recorder of bottom-water Ba because bioturbation combined with temporal abundance variations can bias core tops such that the mean age of each species present might not be the same. Because *Uvigerina spp.* is generally low in abundance during interglacials, *Uvigerina spp.* recovered from core tops are probably less likely to be representative of recent conditions than are *C. wuellerstorfi*.

We average the data in Fig. 2 to calculate an effective distribution coefficient  $D = (\text{Ba/Ca})_{\text{foraminifera}} / (\text{Ba/Ca})_{\text{sea water}}$ . For the fractionation of Ba in the calcite of the three benthic species,  $D = 0.37 \pm 0.06$ . In the present data set there is no evidence for significant differences in individual  $D$  values for each species, although mean  $D$  values range from 0.34 for *Uvigerina spp.* and 0.37 for *C. wuellerstorfi* to 0.41 for *C. kullenbergi*. The uncertainty in  $D$  for each species can be improved by further analyses from high-sedimentation-rate cores, ultimately allowing us to determine whether different benthic species have different effective distribution coefficients.

The estimate of the foraminiferal distribution coefficient applies only to cold deep waters (temperature  $\sim 3^\circ\text{C}$ , pressure  $\sim 300$  bar). Inorganic-precipitation experiments performed at 20–25°C and 1 bar pressure generally yield distribution coefficients of the order of 0.1, although much higher values are observed during the first stages of precipitation or during rapid precipitation<sup>9</sup>. Observed foraminiferal  $D_s$  for chemically similar Sr is about a factor of four times higher than that observed for slow precipitation<sup>17–19</sup>. Measurements of Ba in planktonic foraminifera indicate an effective distribution coefficient of about 0.2 (ref. 20), although the restricted range of Ba concentrations in surface waters limits validation of the direct response of planktonic foraminifera to changes in surface-water Ba concentrations. That this value is significantly different from that for benthic foraminifera suggests that variables such as temperature, pressure and biological factors may play a role in determining  $D$ .

Thus it will be possible to use fossil shells from deep-sea cores to reconstruct the distribution of Ba in the bottom waters of past oceans. A preliminary examination of cores from the North Atlantic indicates that benthic foraminifera recovered from glacial sections have up to 50% higher Ba/Ca ratios than are observed for the Holocene individuals. Higher glacial Ba in the deep Atlantic is an indication of reduced flushing of the Atlantic by nutrient-depleted waters during glacial periods. □

## Stress dependence of the mechanism of the olivine–spinel transformation

P. C. Burnley & H. W. Green II

Department of Geology, University of California, Davis, California 95616, USA

OLIVINE,  $\alpha\text{-(Mg, Fe)}_2\text{SiO}_4$ , is the most abundant phase in the Earth's upper mantle. It transforms to high-density polymorphs ( $\gamma$ , with the spinel structure and  $\beta$ , with a modified spinel structure) under pressure and temperature conditions appropriate to explain the discontinuity in seismic velocities that defines the base of the upper mantle at 400 km depth; the transformation is generally believed to be responsible for that discontinuity<sup>1</sup>. Knowledge of the mechanism and kinetics of the transformation is important for understanding certain aspects of mantle dynamics, and extensive experimental and theoretical work has been conducted on both natural olivine and several analogous chemical systems. Previously, conflicting results have suggested a reconstructive transformation mechanism<sup>2–10</sup>, a martensitic mechanism<sup>11,12</sup> and a mechanism that is not entirely consistent with either<sup>13–16</sup>. The conflicts cannot be explained as different mechanisms operating in different systems<sup>17</sup>. Here we show that the transformation can proceed by two

different mechanisms, depending on the level of nonhydrostatic stress; under hydrostatic pressure or low stresses (at sufficiently high temperatures), nucleation occurs by an incoherent, diffusion-dependent, intercrystalline mechanism proposed by Sung and Burns<sup>2,3</sup> and first demonstrated by Vaughan *et al.*<sup>4</sup> (Fig. 1), whereas under high stresses, nucleation of the high-pressure ( $\gamma$ ) polymorph (spinel) occurs by a coherent, shear-induced, intracrystalline mechanism predicted by Poirier<sup>18</sup>. Thus we are able to reconcile the previously conflicting results, and consideration of the stress levels likely in natural situations leads us to conclude that both mechanisms are geologically relevant.

As part of a continuing study of the effect of stress on the olivine-spinel transformation<sup>19-21</sup>, we deformed specimens of a synthetic  $\text{Mg}_2\text{GeO}_4$  olivine polycrystal (an analogue of the mantle material) at a strain rate of  $10^{-4} \text{ s}^{-1}$ , a temperature of 900 K and pressures of 1.1–1.4 GPa in a modified Griggs apparatus<sup>22</sup>. These conditions are in the spinel stability field, a minimum of 400 K below the equilibrium phase boundary. The specimens are extremely strong, displaying a flow stress ( $\sigma_1$ – $\sigma_3$ ) of 1.9 GPa or more in all cases (Table 1).

Optical microscopy of sections of specimens quenched immediately after deformation showed extremely inhomogeneous deformation within individual olivine crystals, but martensitic (stress-induced) lamellae of the high-pressure polymorph were not found. Examination by transmission electron microscopy (TEM), however, revealed (Fig. 2) thin (1–8 nm) lamellae parallel to (100). (To avoid confusion, we index  $\text{Mg}_2\text{GeO}_4$  olivine according to the unit cell for silicate olivine, in which  $b > c > a$ .) Selected-area electron diffraction (SAED) patterns showed pronounced streaking parallel to the (100) reciprocal lattice direction, but no diffraction spots attributable to the spinel phase were found (Fig. 2, insert), even at specimen strains approaching 35% shortening. The streaking in the diffraction patterns is attributable to the thin lamellae. X-ray diffraction analysis of powders prepared from these specimens also failed to show any spinel lines.

Deformed specimens annealed at 1200 K (at pressure) for longer than 15 min yielded optically visible, faceted spinel crystals; after 1 hour, spinel crystals as large as  $80 \mu\text{m}$  developed, the average diameter being  $50 \mu\text{m}$  (Fig. 3a). The spinel grains nucleated within the olivine crystals, in contrast to spinels grown at higher temperature under hydrostatic or low-stress conditions, which nucleate exclusively at grain boundaries. The interfacial angles between crystal facets indicate that the spinel habit is {111}; growth of several crystals until they interfere commonly leads to irregular shapes, but the {111} facets remain visible (Fig. 3a). Within a single olivine crystal, one {111} facet of each spinel crystal is parallel to one facet of the other spinels and to (100) of the host olivine. Examination of annealed specimens by TEM (Fig. 3b) revealed coarser lamellae than those present in unannealed specimens, and also larger spinel crystals which had lost the lamellar habit. SAED patterns of regions containing coarser lamellae retained the streaking of the as-deformed material, but displayed extra spots characteristic of spinel. Indexing of the patterns showed that  $[100]_{\text{ol}} = [111]_{\text{sp}}$  and  $[001]_{\text{ol}} = [\bar{1}10]_{\text{sp}}$ . The larger crystal of Fig. 3b, although having lost its lamellar habit, retained its largest dimension parallel to

FIG. 1 High-voltage (1,000 kV) transmission electron micrograph of several elongated spinel ( $\gamma$ ) crystals growing into a single olivine ( $\alpha$ ) crystal (white). The variation of contrast and orientation of the planar and linear defects in the spinels demonstrates their widely differing orientations. Electron diffraction confirmed these differences<sup>4,9</sup>, and showed that none of the crystals exhibit the topotaxy predicted by Poirier<sup>18</sup>. Scale bar,  $1 \mu\text{m}$ .

(100)<sub>ol</sub> and exhibited the same topotaxy as the lamellae. By contrast, a specimen annealed under the same conditions but not previously deformed developed no lamellae and no spinel crystals. Our observation of loss of the lamellar habit as coarsening begins suggests that crystal growth occurs by normal phase-boundary migration, leading to euhedral crystals bounded by {111} faces.

The lamellae have all of the characteristics predicted by the martensitic mechanism of Poirier<sup>18</sup>, who constructed his model of the transformation mechanism by analogy with similar martensitic transformations in other systems. In those systems, softening of the appropriate elastic stiffness moduli is observed in the vicinity of the phase boundary. Accordingly, Poirier<sup>18</sup> predicted that the elastic stiffness coefficients  $C_{55}$  and  $C_{66}$  of olivine should show similar premonitory phenomena. A search for such shear-mode softening in  $\text{Fe}_2\text{SiO}_4$  was unsuccessful<sup>23</sup>. We propose that failure of  $C_{55}$  and  $C_{66}$  to soften is complementary to our observations, first that a very high stress is necessary for nucleation by the martensitic mechanism, and second that growth of the  $\gamma$  phase under hydrostatic pressure occurs by

$\dot{\epsilon}$  is strain rate.

normal phase-boundary migration rather than by invasion of the crystal by large numbers of partial dislocations.

These new microstructural results not only indicate that there are two separate mechanisms which operate under different conditions, but also provide the information necessary to reconcile the differences between previous studies<sup>17</sup>. In particular, our new results lead to an understanding of why low-temperature experiments using synchrotron radiation<sup>15,16</sup> showed lack of cation ordering in the early stages of the transformation, even though they indicated volume contraction simultaneous with oxygen restacking<sup>17</sup>. The answer is inherent in Poirier's model. Briefly, Poirier<sup>18</sup> proposed that under conditions appropriate for the transformation, olivine dislocations with a  $[001]$  Burgers' vector gliding on the  $(100)$  plane separate into four partial dislocations according to the reaction:

Implicit in this dislocation mechanism is the fact that a spinel layer produced by passage of the first partial dislocation will have an antiphase relationship with respect to a spinel layer produced by passage of the third partial dislocation (see also Hornstra<sup>24</sup>). Because the individual lamellae are thin and closely

spaced compared with the minimum dimension resolvable by X-ray diffraction, therefore within the same crystal, groups of lamellae with antiphase relationships will be summed by synchrotron radiation, giving rise to anomalously low apparent structure factors for reflections other than those from the oxygen sublattice. As individual crystal domains grow to dimensions resolvable by X-ray diffraction, so too will grow the intensities of the cation-related peaks. In other words, the synchrotron results have been interpreted correctly in that they require cation disorder on the scale of resolution of the technique ( $\sim 100$  nm), whereas in rejecting Poirier's mechanism, the implication is that cation disorder is required on the scale of Poirier's model ( $\sim 1$  nm).

These results also clarify a number of other confusions in the literature. Hamaya and Akimoto<sup>13,14</sup> grew large, euhedral  $\text{Ni}_2\text{SiO}_4$  spinels within olivine single crystals. Some of their

FIG. 2 Transmission electron micrograph and selected-area electron diffraction pattern, suggesting a martensitic nucleation mechanism for the  $\alpha \rightarrow \gamma$  phase transformation. The micrograph is viewed parallel to  $[0\bar{1}2]_{\text{Ol}}$ . Thin lamellar features are parallel to  $(100)$ . No structure of this type in olivine has previously been seen by the authors or reported in the literature, except for Fig. 1 of ref. 12. Some lamellae can be seen to end. Fuzzy black areas are unit dislocations in poor contrast. The high density of slip dislocations makes clear imaging of the lamellae difficult. The insert in the lower left corner is a selected-area electron diffraction pattern, showing streaking normal to  $(100)_{\text{Ol}}$ . Spots corresponding to spinel (e.g.  $[\bar{1}12]_{\text{Sp}}$ ) are not present (arrow). Scale bar,  $0.1 \mu\text{m}$ .

FIG. 3 Annealing at  $1,200$  K of specimens deformed at  $900$  K results in growth of large spinel crystals in the olivine matrix. *a*, Photomicrograph taken between crossed polarizers, showing growth of multiple spinel crystals (isotropic) within a single large olivine grain. The spinels have grown together in many cases, resulting in irregular masses, but each shows a single  $\{111\}$  face (indicated by arrowheads) parallel to that of the other spinels and parallel to the trace of  $(100)$  of olivine (E-W direction of micrograph). *b*, Transmission electron micrograph showing lamellae parallel to  $(100)_{\text{Ol}}$  and a larger, faceted spinel crystal which is elongated parallel to  $(100)_{\text{Ol}}$ , but which does not have a lamellar habit. The larger crystal facet (larger arrowhead) is a  $\{111\}_{\text{Sp}}$  face parallel to  $(100)_{\text{Ol}}$ . The other facets are other  $\{111\}$  planes (smaller arrowheads). Selected-area electron diffraction (SAED) of the lamellar region (insert, lower right) shows weak streaking perpendicular to  $(100)_{\text{Ol}}$  with prominent olivine spots and secondary spinel spots that confirm the topotaxy predicted by Poirier<sup>18</sup>. SAED of the larger spinel crystal (insert, lower left) shows that the position and relative intensity of the spots are identical to those of the spinel spots in the lamellar region, confirming that the larger crystal has exactly the same orientation as the lamellae and indicating that it grew from a lamellar nucleus. Scale bars:  $20 \mu\text{m}$  in panel *a*;  $0.1 \mu\text{m}$  in *b*.

crystals exhibited the topotaxy predicted by Poirier's model, but other crystals displayed the octahedral crystal habit and lacked the topotaxy, making interpretation difficult. In the light of our annealing results, we believe that the simplest explanation for their observations is that stress concentrations produced during pressurization in their apparatus led to production of martensitic nuclei in the earliest stages of their experiments and that coarsening of those nuclei by normal phase-boundary migration during the experiment produced their large, euhedral, crystals. At the temperatures of their experiments, incoherent nuclei were also produced, leading to the crystals that did not display topotaxy with the olivine.

The present results resolve the discrepancies in the literature concerning the mechanism of the transformation in static or quasi-static experiments. The results also imply that the nucleation mechanism should always be martensitic in shock experiments. Indeed, the extreme stresses in shock deformation might lead to complete transformation by the martensitic mechanism rather than the coarsening by normal phase-boundary migration reported here.

One must use caution, however, when extrapolating these results to natural environments, because none of the studies summarized above includes the complication of the  $\beta$  phase<sup>1,17</sup> (which does not exist for most of the analogue materials, including  $\text{Mg}_2\text{GeO}_4$ ). We believe, however, that under most circumstances extrapolation to natural environments should be straightforward. At high temperature and low stress,  $\alpha$  transforms to  $\gamma$  by incoherent nucleation and growth in all systems studied, and  $\gamma \rightarrow \alpha$  in  $\text{Mg}_2\text{GeO}_4$  (ref. 21) and  $\alpha \rightarrow \beta$  in  $\text{Co}_2\text{SiO}_4$  (ref. 25) also follow this mechanism. Therefore, in normal mantle environments, where the temperature is high and stresses are very low, the forward or reverse transformation to either  $\beta$  or  $\gamma$  should be accomplished by the reconstructive mechanism. On the other hand, in shocked meteorites the common circumstance should be sudden transport into the  $\gamma$  stability field at low temperature and high stress (that is, by martensitic nucleation). Immediately thereafter, the stress and pressure will fall and the temperature will rise, in some cases leading to the  $\beta$ -phase before the reaction is quenched<sup>26-28</sup>. Downgoing lithospheric slabs present an environment in which both temperatures and stresses are intermediate between these other two environments. Under such conditions, the data are not yet sufficiently comprehensive to rule out either mechanism. We are continuing our experiments at intermediate temperatures and stresses to pursue this question.

It follows from these results that the level of stress could be a factor in experiments aimed at determination of the mechanism or kinetics of other transformations occurring in the deep Earth. In particular, if a martensitic mechanism is possible, then it is to be expected in shock experiments and also is likely in the laser-heated diamond cell. If such mechanisms are observed, their geophysical significance should be interpreted with caution. □

THE Middle East has been critical to our understanding of recent human evolution ever since the recovery of Neanderthal and early anatomically modern fossils from the caves of Tabun and Skhul (Mount Carmel) over 50 years ago<sup>1-3</sup>. It was generally believed, on archaeological and morphological grounds, that middle eastern Neanderthals (such as those from Tabun, Amud and Kebara) probably dated from more than 50,000 years ago, whereas the earliest anatomically modern specimens (from Skhul and Qafzeh) probably dated from about 40,000 years<sup>3</sup>. Recent thermoluminescence and electron spin resonance (ESR) determinations, however, have supported biostratigraphy in dating the Qafzeh deposits to an earlier part of the late Pleistocene, probably more than 90,000 years ago<sup>4-6</sup>. These dates have been questioned on unspecified technical grounds<sup>7,8</sup>, and it has also been argued that they create explanatory problems by separating the morphologically similar Qafzeh and Skhul samples by some 50,000 years, thus implying a long-term coexistence of early modern humans and Neanderthals in the area<sup>3,7,8</sup>. Here we report the first radiometric dating analysis for Skhul, using ESR on bovine teeth from the hominid burial levels. Early uptake and linear uptake ages average  $81 \pm 15$  and  $101 \pm 12$  kyr respectively. These analyses suggest that the Skhul and Qafzeh samples are of a similar age and therefore it is possible that the presence of early modern humans in the area was episodic, rather than long term during the early late Pleistocene.

The Israeli site of Es Skhul is located in the canyon of Nahal Mearot (Wadi el-Mughareh), near the site of Tabun which has yielded Neanderthal hominid remains. The site of Skhul originally consisted of a 2.5-m thick accumulation of densely cemented, reddish-brown breccia deposited on a triangular rock-cut platform about 11 m above the present level of the wadi floor. McCown<sup>9</sup>, who excavated the site, identified three successively older units. Layer A (<60 cm thick) contained a mixed assemblage of Middle and Upper Palaeolithic artefacts as well as some potsherds. Layer B (a breccia 2 m thick) contained the cranial and post-cranial remains of at least 10 hominids, the majority of which seem to have been intentionally buried, and over 9,800 lithic artefacts representing a Levallois-Mousterian (Middle Palaeolithic) industry. Layer C (a breccia <30-cm thick) contained a sparse industry similar to that in layer B, but no faunal material.

The hominids represent an archaic type of modern *Homo sapiens* and studies of their skeletal morphology demonstrate

FIG. 1 Horizontal bars represent the ESR ages of two teeth from Skhul. Open circles, ESR ages according to early U-uptake; closed circles, ESR ages according to linear, continuous U-accumulation. The ESR and TL dates on Qafzeh are averages as given by Schwarcz *et al.*<sup>6</sup> and Valladas *et al.*<sup>4</sup>. The boundaries of the oxygen isotope stages were taken from Martinson *et al.*<sup>15</sup>.

clear affinities to those from Qafzeh cave, Israel<sup>3,10,11</sup>. To establish an absolute age for Skhul we made ESR measurements on two well-preserved bovid teeth from the British Museum (Natural History) collection. Although the exact positions from which the teeth were recovered is not recorded, it is known that they came from the relatively uniform layer B, which contained the hominids.

The procedures of ESR dating have been described by Grün

*et al.*<sup>12,13</sup>. The additive dose method was used to determine the acquired dose (AD). The U concentrations of enamel and dentine were determined by neutron activation analyses (Table 1). The external cosmic dose rate was calculated on the assumption that a maximum of 2 m of sediment covered the site. The external  $\beta$ -doses were estimated from analyses of the matrix adjacent to the teeth. Unfortunately, the enclosing matrix had been almost entirely removed by the excavators, so that it was not possible to measure the environmental  $\gamma$ -dose rate at the original site. We collected 16 samples of breccia matrix from the 'Mousterian Layers' of the original 1932 excavation as stored in the British Museum. These samples, plus the sediment samples adjacent to the teeth, were analysed for U ( $1.86 \pm 0.62$  p.p.m.), Th ( $2.18 \pm 1.31$  p.p.m.), and K ( $0.451 \pm 0.225\%$ ). These values correspond to a total external dose rate of  $507 \pm 123 \mu\text{Gy a}^{-1}$ , when including a cosmic dose rate of  $120 \pm 20 \mu\text{Gy a}^{-1}$  and a water content of  $10 \pm 10\%$ .

The present-day U content of the enamel ( $0.3\text{--}3.2$  p.p.m.) and dentine ( $6\text{--}12$  p.p.m.) must have been acquired post-mortem: in calculating the ESR age it can be assumed that U was taken up either soon after burial (early uptake, EU), or gradually (linear uptake, LU; see Fig. 1)<sup>12,13</sup>. For a given site, LU ages are generally closer to independently determined ages<sup>14</sup> than the minimum possible age defined by EU. The LU and EU ages of the present samples from Skhul average  $101,000 \pm 12,000$  years ( $101 \pm 12$  kyr) and  $81 \pm 15$  kyr, respectively. The former of these lies between the ESR (LU) and thermoluminescence (TL) dates obtained for Qafzeh ( $115 \pm 15$  kyr<sup>6</sup> and  $92 \pm 5$  kyr<sup>4</sup>, respectively) and is indicative of an early late-Pleistocene age for both sites, corresponding to oxygen isotope stage 5 of the deep-sea record<sup>15</sup>.

Schwarcz *et al.*<sup>16</sup> obtained U-series dates on stalagmitic calcite layers adhering to the bedrock or apparently interlaminated with the breccia. The youngest of a series of calcite layers was dated to  $79 \pm 4$  kyr. Although this agrees with the EU age, calcite may have continued to be deposited in this site after the burial was emplaced.

Previous indirect estimates of the age of this site have been based on comparisons of the lithic industry, fauna and hominid remains with those from other nearby sites, especially Tabun. Higgs<sup>17</sup> surmised, on the basis of a faunal analysis, that layer

EN=enamel; DE=dentine; SED=sediment;  $\beta$ -( )= $\beta$ -dose rate;  $\gamma$ -( )= $\gamma$ -dose rate; int.=internal dose rate.

\* The values for thickness of enamel and the layers removed from both sides (to eliminate the volume irradiated by external  $\alpha$ -rays) were used to calculate the  $\beta$ -attenuation factors<sup>22</sup>.

† ADs and uncertainties were calculated with the computer program FITT<sup>23</sup>.

‡ The uncertainty of the external  $\gamma$ -dose rate consists of the variation of radioactive elements in the sediment samples analysed by NAA and a systematic error for variation of water content<sup>4</sup>.

§ The uncertainty of the external  $\beta$ -dose is caused by a systematic error of water content<sup>4</sup>.

|| The analytical error in the determination of U, Th, and K is negligible for the calculation of the respective dose rates.

B at Skhul might be 10 kyr younger than layer C at Tabun, for which a  $^{14}\text{C}$  date of 51 kyr has been obtained<sup>18</sup>. Jelinek<sup>18</sup> compared the Tabun and Skhul artefacts and concluded that those from Skhul were less than 50 kyr old. Such estimates, as well as morphological dating, have been used to place the Skhul hominids at about 40 kyr<sup>1</sup>.

By contrast, our results show that the ESR dates for teeth associated with the Skhul hominids are indistinguishable from, or only slightly younger than those previously obtained<sup>6</sup> for anatomically similar hominids from Qafzeh. As at Qafzeh, the hominids are associated with a Middle Palaeolithic industry similar to that used at a later time by morphologically distinct Neanderthals elsewhere in this region<sup>19,20</sup>. It is unclear whether this precludes important behavioural differences between the early modern humans and Neanderthals in respects other than lithic industry. The Skhul and Qafzeh dates indicate the existence of anatomically modern hominids in south-west Asia long before their appearance in Europe, and at approximately the same time as their estimated earliest appearance in Africa<sup>5,21</sup>. The extent of any coexistence between early modern humans and Neanderthals in south-west Asia remains unknown, and documentation will depend on further dating work, particularly for Neanderthal sites such as Tabun, Amud and Shanidar. Clarification of the chronological and phylogenetic relationships between the Skhul-Qafzeh hominids and the more fragmentary and archaic humans known from sites such as Gesher Benot Ya'acov, Zuttiyeh and Tabun E is also required<sup>3</sup>.

An early late-Pleistocene age for both the Qafzeh and Skhul samples suggests at least two possibilities for this period of human evolution in south-west Asia. First, the presence of the early moderns might reflect a brief episodic occupation in the area (perhaps from north Africa), preceded by archaic humans associated with the Acheulo-Yabrudian, and followed by archaic humans (Neanderthals), also associated with the Middle Palaeolithic. Alternatively, archaic and early modern humans may have alternated or overlapped in occupation of the area through the Middle Palaeolithic. It remains unclear, however, whether the early late-Pleistocene presence of modern humans in south-west Asia presaged an early spread to east Asia (and much later, into Europe), or whether the further radiation of modern people into both Eurasia and the Far East was later, and unconnected with the evidence from Skhul and Qafzeh<sup>5</sup>. □

## A Middle Palaeolithic human hyoid bone

‡ Department of Sociology and Anthropology, Moorhead State University, Moorhead, Minnesota 56560, USA

THE origin of human language, and in particular the question of whether or not Neanderthal man was capable of language/speech, is of major interest to anthropologists but remains an area of great controversy<sup>1,2</sup>. Despite palaeoneurological evidence to the contrary<sup>3,4</sup>, many researchers hold to the view that Neanderthals were incapable of language/speech, basing their arguments largely on studies of laryngeal/basicranial morphology<sup>1,5,6</sup>. Studies, however, have been hampered by the absence of unambiguous fossil evidence. We now report the discovery of a well-preserved human hyoid bone from Middle Palaeolithic layers of Kebara Cave, Mount Carmel, Israel, dating from about 60,000 years BP. The bone is almost identical in size and shape to the hyoid of present-day populations, suggesting that there has been little or no change in the visceral skeleton (including the hyoid, middle ear ossicles, and inferentially the larynx) during the past 60,000 years of human evolution. We conclude that the morphological basis for human speech capability appears to have been fully developed during the Middle Palaeolithic.

The Kebara hyoid is part of a nearly complete Middle Palaeolithic skeleton (Kebara 2) unearthed during the 1983 joint French-Israeli excavations<sup>7,8</sup>. Figure 1 gives an anterior view of the bone. It is nearly complete—the body and the two greater horns are preserved. The latter are not fused to the body of the bone and the lesser horns are missing. Both of these features are also common in collections of modern human hyoids, because synostosis between the various elements of the hyoid is not always achieved, and in fact the small horns may remain cartilaginous during an individual's lifetime.

The ventral surface of the body presents two deep superior fossae separated by a median crest for the attachment of the geniohyoid muscle, and two less marked latero-inferior fossae for the omohyoid muscle. In a posterior (dorsal) view, the facets for the greater horns are very evident and the surface of the hyoid body is concave and rugged.

FIG. 1 The hyoid bone from Kebara 2 seen in anterior view.

The right greater horn is complete and presents at its proximal end a large articular facet for the body of the hyoid, and at its distal end a small faint attachment surface for the thyrohyoid ligament. The left greater horn is missing its distal end. The principal measurements of the various elements of the hyoid bone are given in Table 1.

The metric traits of the Kebara bone are compared with the hyoid bones of a large sample of anatomically modern humans. The only consistent differences between the fossil bone and those of recent humans are in the maximum medial height of the body and depth of the posterior surface. Yet the former measurement is within the modern human range of variation; only the latter measurement exceeds the means and maximum range found in modern samples. The transverse diameter of the complete hyoid also appears to be large (Table 1), but the accurate position of the greater horns to the body is difficult to assess because of the missing articular cartilages.

Some other bones of the Kebara 2 skeleton present strongly marked metric and morphological differences with like bones of modern humans. For example, the mandible displays four dimensions (bicondylar breadth, bigonial breadth, bimental foramen breadth, and maximum body length) which are beyond

three standard deviations from the means of a sample of modern Bedouin mandibles. Indeed, the unusually large size of the Kebara 2 mandible implies a far greater robusticity of the muscles that relate this bone to the hyoid (for example, mylohyoid, geniohyoid, genioglossus, digastric) than in the Bedouin sample. The differences in the areas of attachment of muscles in Kebara 2 and modern humans are observed only in the mandible and are not reflected in the hyoid bone where insertions remain quite small, as in present-day populations. The hyoid of Kebara 2 thus presents a notable case of morphological stability through time, in sharp contrast to the mandible.

The relatively few morphological and metric changes that have occurred in the hyoid during the last 60,000 (and perhaps 90,000) years have been observed in other visceral bones. There is a marked similarity among the middle ear ossicles of Middle Palaeolithic Neanderthals, early anatomically modern humans, and present-day populations<sup>9-11</sup>. Together, the evidence from the hyoid and middle ear ossicles suggests that the osseous elements derived from the embryonic branchial arches show less rapid evolutionary changes than bones derived from dermal or enchondral tissues. A related inference would be that the associated larynx beneath the hyoid has scarcely changed in

‡ Antero-posterior thickness of body in sagittal plane: one caliper branch tangent to the upper and to the lower posterior margins of the body, the other branch tangent to the most protruding antero-medial point.

§ Depth of the posterior surface of the body: measured from the upper and the lower posterior margins in the sagittal plane.

|| Total maximum length of the bone in the sagittal plane: in projection from distal end of the greater horns to most medio-anterior point of the body, with the greater horns being attached to the body in their anatomical position.

¶ Total maximum breadth of the bone in transverse plane: taken at the most external distal ends of the greater horns, with the greater horns attached to the body in their anatomical position.

position, form, relationships or size during the past 60,000 years of human evolution. If indeed this inference is warranted, the morphological basis for human speech capability appears to have been fully developed during the Middle Palaeolithic, contrary to the views of some researchers<sup>1,5,6</sup>.

The discovery of a fossil hyoid with strong similarities to hyoids of modern populations permits a new perspective on the Middle Palaeolithic human ability to communicate in an articulate language, with far-reaching implications regarding behaviour. The assumed speech limitations of the Neanderthals, that have hitherto been based primarily on studies of basicranial morphology, would seem to require revision. □

## A cost of mating in female fruitflies

Kevin Fowler & Linda Partridge

Department of Zoology, Edinburgh University, West Mains Road, Edinburgh EH9 3JT, UK

**COSTS** of reproduction occur when an increase in reproductive rate reduces future reproduction by increasing mortality or reducing fertility. Such costs have been demonstrated in plants and animals in laboratory and field studies<sup>1–5</sup>. Their importance lies in their possible role in the evolution of life histories and of senescence<sup>6–15</sup>. An understanding of their mechanisms will also reveal the nature of the physiological constraints on longevity and fertility. Most accounts assume that these occur as a result of competition for nutrient allocation between growth, storage, somatic maintenance and reproduction<sup>16–21</sup>. An increase in reproductive rate would then result in a denial of nutrients to other processes, resulting in a drop in life expectancy or future fertility. Some support for this point of view comes from the finding that lifespan is lengthened in female *Drosophila melanogaster* that have inactive or absent ovaries<sup>22–23</sup> or that are experimentally induced to produce fewer eggs<sup>24</sup>. Increased exposure to males, however, also results in a drop in lifespan<sup>24–26</sup>. We show here that mating with males greatly reduces lifespan in female fruitflies whose rates of egg-production and egg-fertility do not differ, suggesting both that simple nutrient allocation to reproduction is not its only physiological cost, and that males can cause females to remate at a frequency that results in reduced female lifetime reproductive success.

Wild-type Dahomey virgin females were collected at eclosion from uncrowded cultures and allocated randomly to two experimental groups, each of 44 flies. The aim was to vary the opportunity for mating between the groups, but to equalize them for both production of fertile eggs and all aspects of pre-mating exposure to males. This was done by keeping each female in the 'high-mating' group permanently with two wild-type males,

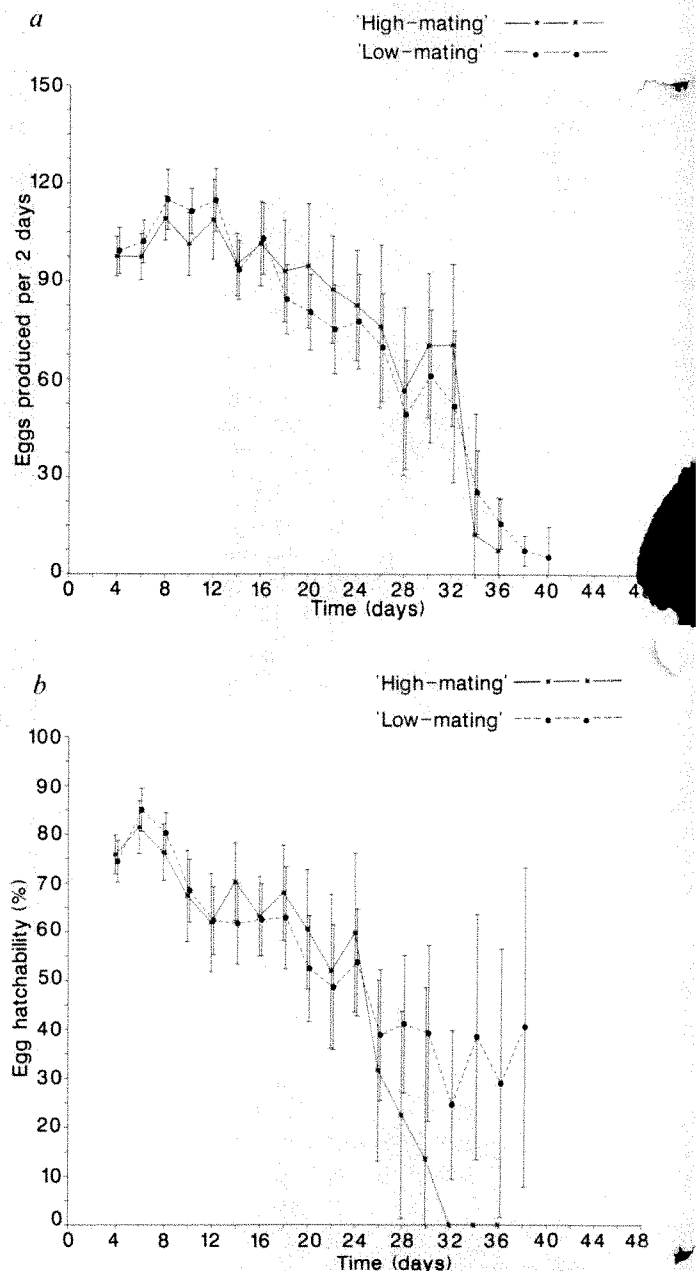

FIG. 1 a, Means (and 95% confidence limits) for the number of eggs produced in each 2-day interval. b, Means (and 95% confidence limits) egg-hatchability, measured for each female as the proportion of eggs laid producing adult progeny for each 2-day time interval.

initially 4-days old and renewed every 10 days. The females in the 'low-mating' group were kept with two wild-type males for 1 day out of 3, and on the remaining 2 days with two males that had had their external genitalia ablated by microcautery. These males courted normally (Table 1), and survived as well in the experiment as intact males, but they could not mate with the females; this was checked before the males were introduced to the experiment, by keeping them individually with two, initially 3-day-old, virgin females for 3 days, and checking for production of larvae. Exposure to microcauterized males resulted in levels of female activity that were not significantly different from those seen in females exposed to intact males (Table 2). All females were kept in 75×24 mm shell vials over 7 ml of freshly yeasted Lewis medium at 25°C on a 12:12 light-dark cycle, and were transferred to fresh vials every 2 days. All flies were handled under CO<sub>2</sub> anaesthesia. All eggs produced were

counted every 2 days, and the vials were retained for a count of the adults emerging, to give a measure of egg-hatchability. In a separate but identical experiment, the amount of mating by the two groups was measured on the one day in three when the 'low-mating' females were exposed to intact males.

The two groups of females showed no significant differences in the numbers of eggs produced (Fig. 1a), nor in the hatchability of eggs (Fig. 1b). The 'high-mating' group remated more frequently than the 'low-mating' group; on the day when both groups had intact males, the proportion of females remating did not differ significantly (Table 1). If these data are extrapolated to include the 2 out of 3 days when the 'low-mating' females had microcauterized males, females in the 'high-mating' group remated significantly more frequently. The 'high-mating' group had significantly lower lifespans than the 'low-mating' group (Fig. 2).

These results show that mating *per se* reduces female lifespan. The mechanism of the effect is at present unknown; it could be a consequence of mechanical injury, transfer of parasites, or an effect of sperm or accessory fluid components on the females. Transfer of parasites is an unlikely explanation, because the intact males used in the experiment were all virgins, and any non-venereal source of infection for males should also have been encountered by females. Use of mutant males may enable the mechanisms to be deduced. Our results suggest that diversion of nutrients into reproduction is unlikely to account for the reduction in lifespan, because the increase in mating was not accompanied by any increase in reproductive output. Females that lay more eggs remate more frequently<sup>27</sup>, so any increase in egg-production would be likely also to incur an additional mating cost.

The females in the 'high-mating' group suffered a drop in lifetime reproductive success as a result of their higher mating rate because their lifespan was reduced, but there was no increase in age-specific progeny production. They would therefore have had increased fitness if they had mated less frequently. Males always gain from a mating, and the finding implies that males can somehow persuade females to mate when it is not in their long term reproductive interests to do so. One possibility is that this is an artefact of the levels of exposure to males used in the experiment, so that the phenomenon would not occur in nature. The frequencies of remating that we have observed, however, are lower than those previously seen in natural or

TABLE 1 Numbers of females mating and courted

	Mating	Not mating
'High-mating'	15	264
'Low-mating'	25	983
	Courtship	No courtship
'High-mating'	97	173
'Low-mating'	108	166

Number of females mating in 33 h of direct observation in the 3 h after lights on, spread evenly over 11 days in the first 36 days of the experiment. For both groups the 'mating' total is the number of females mating on the sampling days. For the 'high-mating' group, the 'not mating' total is the number of females present on the sampling days that did not mate. For the 'low-mating' group, the 'not-mating' total is the number of females present on the sampling days that did not remate, plus the number of females present on the day before and the day after the sampling day.  $\chi^2$  1 d.f. = 6.1,  $P < 0.02$ . Lower part of table shows number of females courted in spot samples within 3 h of lights on and spread throughout the days of the experiment, on days when the 'low-mating' females were exposed to microcauterized males. Male courtship was defined as wing vibration or attempted copulation.  $\chi^2$  1 d.f. = 0.71,  $p > 0.4$ .

TABLE 2 Levels of female activity

	Courtied		Not courtied	
	Moving	Still	Moving	Still
'High mating'	24	73	28	145
'Low mating'	27	81	30	136

Spot samples of female movement (walking or running) while courtship was or was not occurring. Observations were spread evenly through the experiment, on days when the 'low-mating' females were exposed to microcauterized males. For courtship samples,  $\chi^2$  1 d.f. = 0.002 NS, for non-courtship samples  $\chi^2$  1 d.f. = 0.213 NS.

semi-natural populations<sup>28</sup>. This seems, therefore, to be a case where a conflict of interest between the sexes has been at least temporarily resolved in favour of males. This result does not support the idea that multiple mating may be of advantage to females<sup>29</sup>. □

FIG. 2 Survival curves for 'high-mating' and 'low-mating' females. Cumulative survival probability is the proportion of females still alive at the end of each sampling interval.  $\chi^2$  1 d.f. = 15.4,  $P < 0.001$  Log Rank Test (this test compares the observed numbers of deaths in each group in each sampling interval with the numbers expected if the observed deaths occurred in proportion to the numbers of flies present in each group).

## 5-HT<sub>3</sub> receptors mediate inhibition of acetylcholine release in cortical tissue

J. M. Barnes, N. M. Barnes, B. Costall,  
R. J. Naylor & M. B. Tyers\*

Postgraduate Studies in Pharmacology, The School of Pharmacy,  
University of Bradford, Bradford, BD7 1DP, UK

Ware, Herts, SG12 0DP, UK

THE release of cerebral acetylcholine from terminals in the cerebral cortex has been shown to be regulated by 5-hydroxytryptamine (5-HT)<sup>1-6</sup> but it is not known which subtype of the 5-HT receptor is involved. 5-HT receptor agonists increase acetylcholine levels *in vivo*<sup>1,2</sup>, indicating a reduced turnover, and reduce release of acetylcholine from striatal slices *in vitro*<sup>3-5</sup>. Depleting 5-HT by inhibiting synthesis or by destroying the neurons containing 5-HT potentiates acetylcholine release<sup>5</sup>, and increases acetylcholine turnover in the cerebral cortex and hippocampus<sup>6</sup>. Selective antagonists for the 5-HT<sub>3</sub> receptor subtypes which seem to have effects on mood and activity<sup>7-10</sup> may exert their effect through the regulation of acetylcholine release in the cortex and limbic system. Radioligand binding studies show a high density of 5-HT<sub>3</sub> receptors in the cholinergic-rich entorhinal cortex<sup>11,12</sup> and we provide evidence that a reduction in cortical cholinergic function can be effected *in vitro* by 5-HT<sub>3</sub> receptors.

Release of [<sup>3</sup>H]acetylcholine from rat entorhinal cortex preloaded with [<sup>3</sup>H]choline was stimulated by potassium. Previous studies have shown that the tritium released is [<sup>3</sup>H]acetylcholine, and that the release is calcium-dependent<sup>13</sup>. 5-HT (2 µM) or the selective 5-HT<sub>3</sub> receptor agonist, 2-methyl-5-HT (ref. 14; 2 µM) inhibited potassium-stimulated [<sup>3</sup>H]acetylcholine release by some 50% (*P* < 0.001), but only in the presence of the 5-HT<sub>2</sub>/5-HT<sub>1C</sub> receptor antagonist ritanserin<sup>15</sup> (Table 1). Alone, the 5-HT<sub>3</sub> receptor antagonists GR38032F (ref. 16) and

zacopride<sup>17</sup> (both at 1 nM) failed to alter basal or evoked [<sup>3</sup>H]acetylcholine release, although they antagonized the reduction in evoked release induced by 2-methyl-5-HT (2 µM) in the presence of ritanserin (1 µM) (Table 1). In the absence of ritanserin, 2-methyl-5-HT in the presence of GR38032F or zacopride caused 107 and 37% increases in potassium-stimulated [<sup>3</sup>H]acetylcholine release, respectively (Table 1). The ritanserin sensitivity of this excitatory effect suggests mediation

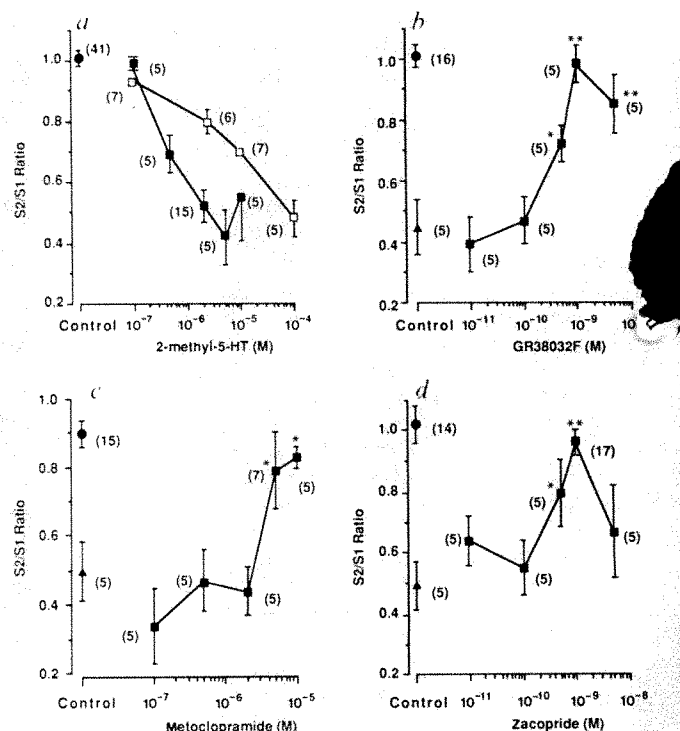

FIG. 1 Inhibition of potassium-stimulated [<sup>3</sup>H]acetylcholine release by 2-methyl-5-HT (0.1–10.0 µM) and antagonism by metoclopramide (0.1–10.0 µM), GR38032F (0.01–10.0 nM) or zacopride (0.01–10.0 nM). Ritanserin (1 µM) was used in all experiments. The entorhinal cortex from female, Hooded Lister rats (250–300g, Bradford bred) was cross-chopped at 90° (McIlwain tissue chopper) to produce slices 0.35 × 0.35 mm × thickness of cortical ribbon. Tissue was obtained from 20 rats for each experiment and each chamber contained tissue from a single rat. The cut tissue was washed three times in gassed (95% O<sub>2</sub>/5% CO<sub>2</sub>) Krebs solution (NaCl 118.0, KCl 4.75, KH<sub>2</sub>PO<sub>4</sub> 1.2, MgSO<sub>4</sub> · 7H<sub>2</sub>O 1.2, CaCl<sub>2</sub> 2.5, NaHCO<sub>3</sub> 25.0, glucose 11.0 mM). The Krebs solution was then replaced by one containing 39.75 mM KCl (tonicity was maintained by reducing the NaCl concentration) and the tubes shaken at 37 °C for 20 min. After being washed the slices were incubated at 37 °C for 40 min in normal Krebs buffer containing [<sup>3</sup>H]choline, 0.1 µM (15 Ci mmol<sup>-1</sup>, Amersham). 200 µl washed settled slices were placed into each of the 20 superfusion baths and superfused with Krebs solution (0.5 ml min<sup>-1</sup>) containing 1.0 µM hemicholinium-3 at 37 °C. After a 30 min washout period, 4-min samples of perfusate were collected. At 12 min (S<sub>1</sub>) and 48 min (S<sub>2</sub>) the slices were depolarized by changing the superfusion fluid for 4 min to a Krebs solution containing 20 mM KCl. The superfusate samples were collected for a total of 80 min. Tritium content was assayed by liquid scintillation spectroscopy (Tri-Carb 1900CA, efficiency 47%). The evoked release of radioactivity was calculated as the difference between potassium-stimulated and basal release. On completion of the experiment, the tritium remaining in the slices was determined. The disintegration per min, per 4-min collection period, was converted to fractional release by dividing by the total amount of radioactivity present in the tissue at the end of each 4-min collection period<sup>13</sup>. Ordinates, mean S<sub>2</sub>/S<sub>1</sub> ratio ± s.e. calculated from *n* determinations. Abscissa, concentrations of agonist or antagonists. *a*, Concentration-response curves to 2-methyl-5-HT in the absence (■) and presence (□) of GR38032F (10 nM). *b*, *c* and *d*, Antagonism of 2-methyl-5-HT (▲, 2 µM) by GR38032F, metoclopramide and zacopride, respectively. Significant differences from 2-methyl-5-HT (2 µM) response are shown as \**P* < 0.05, \*\**P* < 0.01; ●, control response.

TABLE 1 Influence of 5-HT agonists and antagonists on [<sup>3</sup>H]acetylcholine release

Treatment	Evoked [ <sup>3</sup> H]acetylcholine release	
	Control	Treatment
5-HT	0.90 ± 0.03 (5)	0.77 ± 0.06 (4)
5-HT + Ritanserin	1.05 ± 0.03 (5)	0.51 ± 0.06 (4)*
2-Methyl-5-HT	0.98 ± 0.06 (5)	1.11 ± 0.14 (5)
2-Methyl-5-HT + Ritanserin	0.96 ± 0.06 (10)	0.52 ± 0.05 (15)*
Ritanserin	1.06 ± 0.07 (8)	0.91 ± 0.07 (5)

Zacopride	1.01 ± 0.10 (5)	0.99 ± 0.05 (3)
2-Methyl-5-HT + Zacopride	0.98 ± 0.06 (5)	1.34 ± 0.15 (6)*
2-Methyl-5-HT + Zacopride + Ritanserin	1.01 ± 0.04 (14)	0.98 ± 0.04 (12)†

Influence of 5-HT agonists and antagonists, alone and in combination, on potassium-stimulated (20 mM) release of [<sup>3</sup>H]acetylcholine from slices of rat entorhinal cortex (see Fig. 1). All test drugs were added 20 min before, during and after the S<sub>2</sub> stimulation, and the S<sub>2</sub>/S<sub>1</sub> ratio was subsequently calculated: 5-HT (2 µM), 2-methyl-5-HT (2 µM), ritanserin (1 µM), GR38032F (1 nM), zacopride (1 nM). Mean S<sub>2</sub>/S<sub>1</sub> ratios ± s.e. and the numbers of rats used (*n*) for each determination are shown. Significant decreases or increases of S<sub>2</sub>/S<sub>1</sub> ratios compared with corresponding controls were determined using Dunnett's *t* test (*P* < 0.01\*). † Indicates significant antagonism of these effects by GR38032F, zacopride or ritanserin (*P* < 0.01).

through 5-HT<sub>2</sub> or 5-HT<sub>1C</sub> sites; although the involvement of 5-HT<sub>2</sub> receptors may be questioned as other functional studies have shown 2-methyl-5-HT to have little effect at the concentrations used in the present studies<sup>14</sup>.

The inhibitory effect of 2-methyl-5-HT on potassium-stimulated [<sup>3</sup>H]acetylcholine release was concentration-dependent in the 0.5–10.0  $\mu$ M range, which is typical of its potency for 5-HT<sub>3</sub> receptor-mediated responses<sup>14,16,18,19</sup>. Metoclopramide (5–10  $\mu$ M), GR38032F (0.5–5.0 nM) and zacopride (0.5–1.0 nM) showed a concentration-dependent antagonism on the inhibitory effect of 2-methyl-5-HT (2  $\mu$ M) (Fig. 1). The pIC<sub>50</sub> value ( $\pm$ s.e.) for zacopride, calculated from the rising portion of the antagonist response curve, was  $9.38 \pm 0.08$  (sample size,  $n = 5$ ) which is similar to reported values (5-HT<sub>3</sub> binding pK<sub>i</sub> = 8.70 (ref. 12), functional pA<sub>2</sub> values 8.5–10.1 (ref. 17)). The pIC<sub>50</sub> value for metoclopramide ( $5.80 \pm 0.09$ ;  $n = 5$ ), however, was slightly lower than expected (5-HT<sub>3</sub> binding pK<sub>i</sub> 6.45–6.49 (refs 11 and 12), functional pA<sub>2</sub> values 6.6–7.2 (refs 19 and 20)), which may reflect an antagonism of dopamine receptors.

In further concentration-response studies, GR38032F (10 nM) caused a parallel rightward shift in the 2-methyl-5-HT inhibitory concentration-response curve without changing the maximum response (dose ratio 15.6, Fig. 1). The competitive affinity (pK<sub>B</sub>  $\pm$  s.e.) for the antagonist GR38032F was  $9.04 \pm 0.12$  ( $n = 5$ ); this value is similar to those reported previously in functional systems (pA<sub>2</sub> 8.13–9.40 (ref. 16)) and binding assays (pK<sub>i</sub> 8.32–8.54 (refs 11 and 12)).

The specificity for 5-HT<sub>3</sub> receptors of the 2-methyl-5-HT (2.0  $\mu$ M) inhibitory effect (in the presence of 1  $\mu$ M ritanserin) was confirmed by the failure of other antagonists to influence the evoked [<sup>3</sup>H]acetylcholine release or its inhibition by 2-methyl-5-HT (namely, methysergide, fluphenazine, prazosin, propranolol, sulpiride, idazoxan, naloxone, atropine, mepyramine, ranitidine and chlordiazepoxide, all at 1  $\mu$ M).

Two concepts emerge from these *in vitro* studies. First, activation of 5-HT<sub>3</sub> receptors can reduce acetylcholine release from the cerebral cortex, and, second, 5-HT<sub>3</sub> receptor antagonists may act by facilitating acetylcholine release. Such a facilitation could be achieved either by directly preventing the inhibitory effect of a 5-HT<sub>3</sub>-receptor agonist or by allowing a facilitatory agonist to act at putative 5-HT<sub>2</sub>/5-HT<sub>1C</sub> receptors (ritanserin-sensitive sites). The increases in cortical acetylcholine release we report were effected by 5-HT receptor antagonists at affinities consistent with those determined in other 5-HT<sub>3</sub> receptor models (refs 11, 12, 16, 17, 19 and 20). GR38032F and zacopride, highly selective 5-HT<sub>3</sub> receptor antagonists, are particularly potent, and these novel psychotherapeutic agents may provide a link in the search for relieving the consequences of impaired cortical cholinergic function. □

RED blood cells infected with mature stages of the malaria parasite *Plasmodium falciparum* bind to the endothelial lining of capillaries and venules. This sequestration is important for the survival of the parasite but may have severe consequences for the host. For example, it is involved in the causation of cerebral malaria which carries 25% mortality<sup>1–5</sup>. Knob-like protrusions present on the surface of infected erythrocytes have been considered necessary but not sufficient for this cytoadherence<sup>6–8</sup>. Here we describe the adhesion to endothelial cells of infected erythrocytes which do not have knobs. A human monoclonal antibody (33G2) which was specific for an epitope containing regularly spaced dimers of

glutamic acid present in the repeated amino-acid sequences of some defined *P. falciparum* antigens<sup>9,10</sup> was found to inhibit cytoadherence and may therefore be an important reagent for elucidating the molecular basis of parasite sequestration.

A bulk culture of the Palo Alto (PA) strain of *P. falciparum* bound poorly to the melanoma cell line C32 (100–200 infected red blood cells (RBC) per 100 melanoma cells). However, the number of binding RBC was significantly increased (2,000–3,000 RBC per 100 melanoma cells) after four consecutive adsorptions to melanoma cells and subsequent culture of the adherent infected RBC *in vitro* (Fig. 1). The cytoadherent RBC (C<sup>+</sup>) also bound to blood monocytes (1,000–1,200 RBC per 100 monocytes) and to endothelial cells from the human umbilical cord (100–3,400 RBC per 100 endothelial cells). The C<sup>+</sup> phenotype was stable and was retained for at least eight months, although at a somewhat lower level (600–800 RBC per 100 melanoma cells).

Previous studies of cytoadherence by transmission electron microscopy (TEM) have shown that the points of close contact between infected RBC and endothelial cells were knobs<sup>1–5,7,8</sup>. TEM showed that the C<sup>+</sup> cells, as well as those of the original PA culture we investigated, lacked knobs (K<sup>−</sup>) (Fig. 2a), and that the adhesion sites between RBC and melanoma cells were close and short alignments of the plasma membranes (Fig. 2b). When probed in immunofluorescence with the mouse monoclonal antibody 89, which is specific for the knob-associated antigen HRP-1 (KAHRP)<sup>11</sup>, the staining of K<sup>−</sup> C<sup>+</sup> RBC was essentially negative.

Like the melanoma-binding of K<sup>+</sup> cells<sup>6,12</sup>, that of K<sup>−</sup> cells was trypsin-sensitive (binding ~45% of control at 100  $\mu$ g ml<sup>−1</sup>) and was inhibited by the monoclonal antibody (mAb) OKM5 directed against the antigen CD36 on platelets, endothelial cells, melanoma cells and monocytes<sup>13,14</sup>. These results indicate that the molecular events involved in cytoadherence of K<sup>+</sup> and K<sup>−</sup>

<sup>§</sup> To whom correspondence should be addressed.

cells are similar or identical. But further experiments are needed to settle this question and also to establish the possible involvement of thrombospondin<sup>2,15</sup> in the cytoadherence of K<sup>-</sup> cells.

Only one of five immunoglobulins (IgGs) from *P. falciparum* immune donors inhibited cytoadherence of K<sup>-</sup> cells to melanoma cells (50% inhibition titre, 2 mg ml<sup>-1</sup>), although all

FIG. 1. Giemsa-stained *P. falciparum* RBC (Palo Alto) binding to melanoma cells (C32r).

**METHODS.** The cytoadherence assay was performed as described<sup>25</sup>. Briefly, melanoma cells grown on cover slips were fixed with 1% formaldehyde in phosphate-buffered saline (PBS) and stored at 4 °C until used. C<sup>+</sup> RBC (trophozoites/schizonts; 5–10% parasitaemia) were incubated with the melanoma cells at room temperature on a rotating platform for 1 h. Unbound RBC were flushed loose with PBS until only bound RBC remained. The coverslips were fixed with 1% glutaraldehyde in PBS, stained with Giemsa and examined in the light microscope.

FIG. 2 *a*, Knobless *P. falciparum* RBC (Palo Alto) and *b*, binding (arrow) to a melanoma cell (Mc), as seen by transmission electron microscopy.

**METHODS.** Melanoma cells were grown in Petri dishes and fixed with 1% formaldehyde for 1 h. After immersion in PBS containing 0.2% BSA, they were scraped loose from the dishes. The cell suspensions were mixed with an equal volume of C<sup>+</sup> RBC (5–10% parasitaemia) and incubated under gentle rotation for 1 h at room temperature. The RBC/melanoma conjugates were collected by sedimentation and washed by addition of fresh PBS until most of the unbound RBC were removed. The sediments were fixed for 1 h at room temperature with 2.5% glutaraldehyde in 0.05M PBS (pH 7.4) containing 4% sucrose. After fixation, embedding and sectioning was as described<sup>26</sup>.

gave positive immunofluorescence with the surface of RBC containing late-stage parasites. But the human monoclonal antibody 33G2 (IgM,  $\kappa$ ) prepared from a malaria-immune donor<sup>16</sup>, strongly inhibited the binding of the K<sup>-</sup> cells in a dose-dependent manner (Fig. 3*b*). These results indicate either that the structures involved in cytoadherence of K<sup>-</sup> cells are weakly immunogenic, or that the corresponding antigens display a strain diversity similar to that seen in the cytoadherence of K<sup>+</sup> cells<sup>17,18</sup>.

The inhibitory human mAb 33G2 both stains the surface of suspended (unfixed) K<sup>-</sup>C<sup>+</sup>-PA cells in immunofluorescence and agglutinates these cells, indicating that there is a surface expression of the corresponding epitope. Staining, agglutination and cytoadherence inhibition were also obtained with K<sup>+</sup>-cultures of the Gambian *P. falciparum* strain FCR-3. Interestingly, RBC infected with PA parasites depleted of C<sup>+</sup> cells by repeated melanoma adsorptions were neither stained nor agglutinated by 33G2 and this was also true for K<sup>-</sup>C<sup>-</sup> cells infected with the Tanzanian strain F32. Taken together, these results suggest that the epitope seen by the 33G2 antibody is associated with cytoadherence of both K<sup>+</sup> and K<sup>-</sup> RBC.

Antibody 33G2 is specific for a repeated epitope consisting of regularly spaced dimers of glutamic acid in antigen 332, parasite-encoded polypeptide present in the membrane of RBC containing mature asexual stages of *P. falciparum*<sup>9,10</sup>. So far no

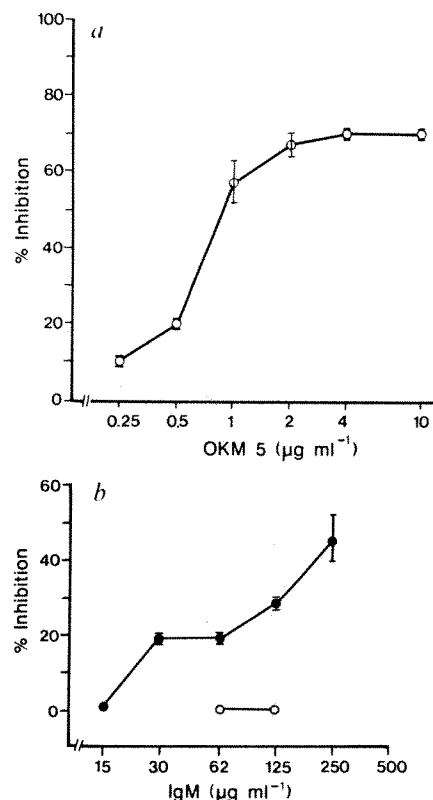

FIG. 3 Inhibition of cytoadherence by different antibodies. *a*, Inhibition by the monoclonal mouse antibody OKM5. *b*, Inhibition by the human monoclonal IgM antibody 33G2 (●). A human monoclonal IgM antibody specific for bacterial lipopolysaccharide (provided by Dr A. Rosén) was used as a control (○).

**METHODS.** *a*, Coverslips with formaldehyde-fixed melanoma cells (1% in PBS) were incubated with twofold dilutions of mAb OKM5 (0.25–10  $\mu\text{g ml}^{-1}$ ) for 30 min at room temperature. After three washes with PBS, C<sup>+</sup> RBC (Palo Alto) were added to the melanoma cells and the binding assay was performed as described (Fig. 1). The number of bound RBC per 100 melanoma cells was counted and expressed as the percentage of bound cells. *b*, Aliquots (0.5 ml) of concanavalin A-purified 33G2 (ref. 16) or of the control antibody were added to the pellets (15–250  $\mu\text{g ml}^{-1}$ ) and incubated for 30 min at 37 °C (total volume ~0.2 ml). One ml of PBS was added to each tube after incubation and the mixtures were then applied to the melanoma cells on coverslips. The binding assay and calculations were as in *a*. In each case, the mean and range % inhibition from two experiments are shown.

differences have been seen when lysates of  $C^+$  or  $C^-$  parasites separated by SDS-PAGE were probed with 33G2 in immunoblotting, and the possible relationship of antigen 332 to any of the polypeptides previously postulated to be associated with cytoadherence<sup>19-21</sup> is unknown. Antibody 33G2 cross-reacts with similar sequences of genetically unrelated *P. falciparum* antigens such as Pf155/RESA<sup>9,16</sup>, which cannot be implicated in cytoadherence<sup>19</sup>. But it also binds to Pf11.1 (refs 9, 22 and 23), a high-molecular weight polypeptide which may play a part in this process<sup>19</sup>. Thus it is not clear at present whether it is antigen 332, Pf11.1 or some other cross-reacting antigen which is responsible for cytoadherence-inhibition by antibody 33G2.

The present findings apparently conflict with earlier results, in so far as knobs at the surface of erythrocytes infected with asexual *P. falciparum* parasites have been considered necessary for cytoadherence. Sequestration of immature *P. falciparum* gametocytes has, however, been shown to occur independently of knob protrusions<sup>24</sup>. Similarly, sequestration of RBC containing asexual stages in other malarias (*P. knowlesi*, *P. berghei*, *P. chabaudi*) may also occur in the absence of knobs, whereas in other malarial species (*P. malariae*, *P. brasilianum*), infected RBC express knobs but do not cytoadhere<sup>19</sup>. Thus the presence of knobs seems necessary for cytoadherence of some parasite populations but not others. In any event, as the human monoclonal antibody 33G2 efficiently inhibits cytoadherence it may become a useful adjunct in the treatment or prophylaxis of severe *P. falciparum* malaria. □

THE repertoire of receptors expressed by peripheral T cells is the result of two selective events that occur during intrathymic development. Positive selection expands cells able to recognize foreign peptides presented by self MHC molecules, and negative selection eliminates cells reactive to self MHC molecules and associated self peptides<sup>1-4</sup>. Chimaera studies suggest that, at least in the case of T cells recognizing MHC class II, interaction with thymic cortical epithelial cells is responsible for the former<sup>5</sup>, whereas thymic medullary cells, of bone marrow origin, mediate the latter<sup>3,6-8</sup>. This view of thymic development is supported by recent morphometric analyses<sup>9</sup>, showing that autoreactive cells are found in thymic cortex but not medulla. Although numerous studies have shown that MHC class II molecules are expressed in both sites, none provides any explanation for the differential selection of T cells that is observed. Here, we describe a novel MHC class II epitope which is found on cells in thymic medulla but not cortex. The antibody to this epitope reacts with about 10% of class II molecules on B cells and may be recognizing a self peptide-MHC complex. These results provide the first evidence for differential expression of class II epitopes in different tissues and are compatible with the hypothesis that different ligands<sup>2,13-16</sup>,

rather than different affinity thresholds for the same ligand<sup>17,18</sup>, are involved in positive and negative selection of the T-cell repertoire.

The monoclonal antibody used in this study, Y-Ae, was produced by immunizing class II incompatible mice with lipopolysaccharide activated spleen cells (Fig. 1). The antibody specifically reacts with splenic B cells from strains which express I-A<sup>b</sup>(A<sup>b</sup>E<sup>b</sup>) and I-E<sup>b</sup>(E<sup>b</sup>E<sup>b</sup>) surface complexes, such as donor strain B10.A(5R) (Fig. 1a, b). It does not react with I-A molecules alone, as cells which express surface I-A<sup>b</sup> molecules, including strain B10.A(18R) spleen cells (Fig. 1a) and L cells transfected with A<sup>b</sup> and E<sup>b</sup> genes (Fig. 1c), are Y-Ae-negative. The antibody also does not react with I-E molecules, as several cell types that express surface I-E<sup>b</sup> complexes, including L cells transfected with E<sup>d/k</sup> and E<sup>b</sup> genes (Fig. 1d) and (B6.C-H-2<sup>bm-12</sup> × B10.TFR5)F1 spleen cells (Fig. 1h), are type Y-Ae-negative. However, both I-A and I-E genes influence the Y-Ae determinant. Formal proof that the E<sup>a</sup> gene or surface E<sup>a</sup>E<sup>b</sup> complexes are involved comes from the observation that Y-Ae reacts with spleen cells from B6-E<sup>d</sup> transgenic strain 107.1 (Fig. 1f) but not progenitor B6 (Fig. 1e). Studies with A<sup>b</sup> mutant strain B6.C-H-2<sup>bm-12</sup> provide clear evidence that at least the A<sup>b</sup> gene also influences Y-Ae activity, as shown by reactivity of the antibody with (B6 × BALB/c)F1 (Fig. 1g) but not (B6.C-H-2<sup>bm-12</sup> × B10.TFR5)F1 (Fig. 1h).

Evidence that the Y-Ae antibody binds to a modified form of I-A complexes comes from several sources. First, the antibody precipitates only mature forms of A<sup>a</sup> and A<sup>b</sup> chains from biosynthetically labelled spleen cell lysates (Fig. 2). No E<sup>a</sup> chains, E<sup>b</sup> chains, or invariant (Ii) polypeptides were observed in these immunoprecipitates. This formally excludes the possibility that the antibody reacts with mixed isotype E<sup>a</sup>A<sup>b</sup> dimers. Previous study showed that E<sup>a</sup> chains cannot pair with A<sup>b</sup> chains<sup>19</sup>. Failure to detect Ii chains suggests that the antibody reacts only with surface forms of class II molecules<sup>20</sup>. Second, several monoclonal antibodies<sup>21,22</sup> that react with sites influenced by  $\alpha$ -helical residues on A<sub>2</sub>(Y-3P, Y-248) or A<sub>2</sub>(Y-238) chains inhibit binding of Y-Ae to the lymphocyte surface, whereas monoclonal antibodies reactive with other parts of I-A molecules (Y-219) or with I-E molecules (Y-17, 14-4-4) failed

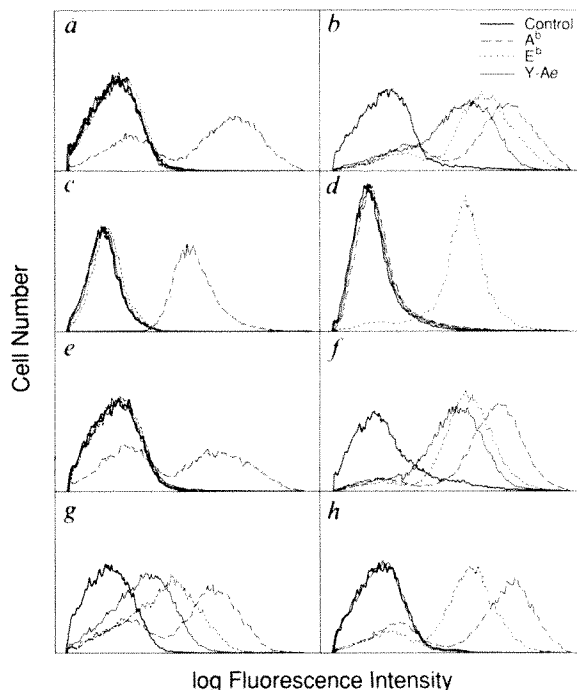

† Present address: Laboratory of Immunology, The Wadsworth Center, New York State Department of Health, Empire State Plaza, Albany, New York 12201, USA.

to block (data not shown). Third, and most important, Y-Ae binds to about 10% of surface I-A molecules, as judged by competitive inhibition and quantitative binding analyses (Fig. 3). Taken together, these studies demonstrate that Y-Ae binds to a novel B-cell epitope on a subset of I-A<sup>b</sup> molecules in strains expressing surface I-E<sup>b</sup> molecules.

**FIG. 1** The Y-Ae antibody does not react with conventional I-A and I-E molecules, yet both I-A and I-E genes influence the Y-Ae determinant. Immunofluorescent analysis was carried out using the following biotin-conjugated monoclonal antibodies and cells. Control (—): anti-I-A<sup>b</sup>(A<sub>α</sub>A<sub>β</sub>), γ2b, 11.5.2 (ref. 24); A<sup>b</sup>(---): anti-I-A<sup>b</sup>(A<sub>α</sub>A<sub>β</sub>), γ2a, Y-3P (ref. 25); E<sup>b</sup>(· · · · ·): anti-I-E<sup>b</sup>(E<sub>α</sub>E<sub>β</sub>), γ2b, Y-17 (ref. 26); and Y-Ae (—): (B10.D2 × B10.MBR)/F1 anti-B10.A(5R) fused with Ag-8 and cloned by limiting dilution, γ2b. Panel a, B10.A(18R) spleen cells, which express A<sub>α</sub>A<sub>β</sub> surface molecules and E<sub>β</sub> cytoplasmic chains, but not E<sub>α</sub> chains. b, B10.A(5R) spleen cells which express A<sub>α</sub>A<sub>β</sub> and E<sub>α</sub>E<sub>β</sub> surface molecules. c and d, L cells transfected with A<sub>α</sub> and A<sub>β</sub> genes (c) or with E<sub>α</sub> and E<sub>β</sub> genes (d), gifts of Dr R. Germain<sup>27,28</sup>. e, B6 spleen cells, which possess a nonfunctional E<sub>α</sub> gene and express A<sub>α</sub>A<sub>β</sub> surface complexes and E<sub>β</sub> cytoplasmic chains. f, B6-E<sub>α</sub> transgenic strain 107-1 spleen cells, which possess a functional E<sub>α</sub> transgene and express A<sub>α</sub>A<sub>β</sub> and E<sub>α</sub>E<sub>β</sub> surface molecules in a normal manner. g, (B6 × BALB/c)F1 spleen cells which express A<sub>α</sub>A<sub>β</sub> and E<sub>α</sub>E<sub>β</sub> surface molecules. h, (B6.C-H-2<sup>bm-12</sup> × B10.TFR5)F1 spleen cells, which express mutant A<sub>α</sub>A<sub>β</sub><sup>bm-12</sup> and normal E<sub>α</sub>E<sub>β</sub> surface molecules. Similar results were obtained with (B6 × A.TFR5)F1(Y-Ae<sup>+</sup>) and (B6.C-H-2<sup>bm-12</sup> × A.TFR5)F1 (Y-Ae<sup>-</sup>) spleen cells (data not shown). Relevant difference between both sets of F1 hybrids is in the A<sub>β</sub> chain, where A<sub>β</sub><sup>bm-12</sup> differs from A<sub>β</sub><sup>bm-12</sup> at residues 67, 70 and 71 (ref. 29). In summary, the Y-Ae positive strains tested include: B10.A(5R), B10.A(3R), B10.BAR23, B10.BAR26, B10.BAR27, all 5R-like strains which express surface A<sub>α</sub>A<sub>β</sub> and E<sub>α</sub>E<sub>β</sub> complexes<sup>30</sup>, and B6-E<sub>α</sub> strain 107-1. The Y-Ae negative strains tested include: B6, B10, BALB.B, A.BY, B10.D2, BALB/c, B10.M, A.CA, B10.BR, BALB.K, C3H, B10.F(13R), B10.G, B10.RIII, B10.S, A.SW, B10.PL, B10.SM, B10.A, A, B10.A(2R), B10.A(4R), B10.A(18R), B10.MBR, B10.GD, A.TFR5, B10.TFR5, B10.HTT, B10.S(9R), B6.C-H-2<sup>bm-12</sup>, and B6-E<sub>α</sub> transgenic strain 36-5.

**METHODS.** Biotin-conjugated antibodies were added to spleen cell or L-cell suspensions for 30 min at 4 °C in phosphate-buffered saline containing 2% fetal calf serum, 0.1% sodium azide, and 1 mg ml<sup>-1</sup> normal mouse immunoglobulin to inhibit binding to Fc receptors (staining buffer). All antibodies were used at plateau staining concentrations. After washing with

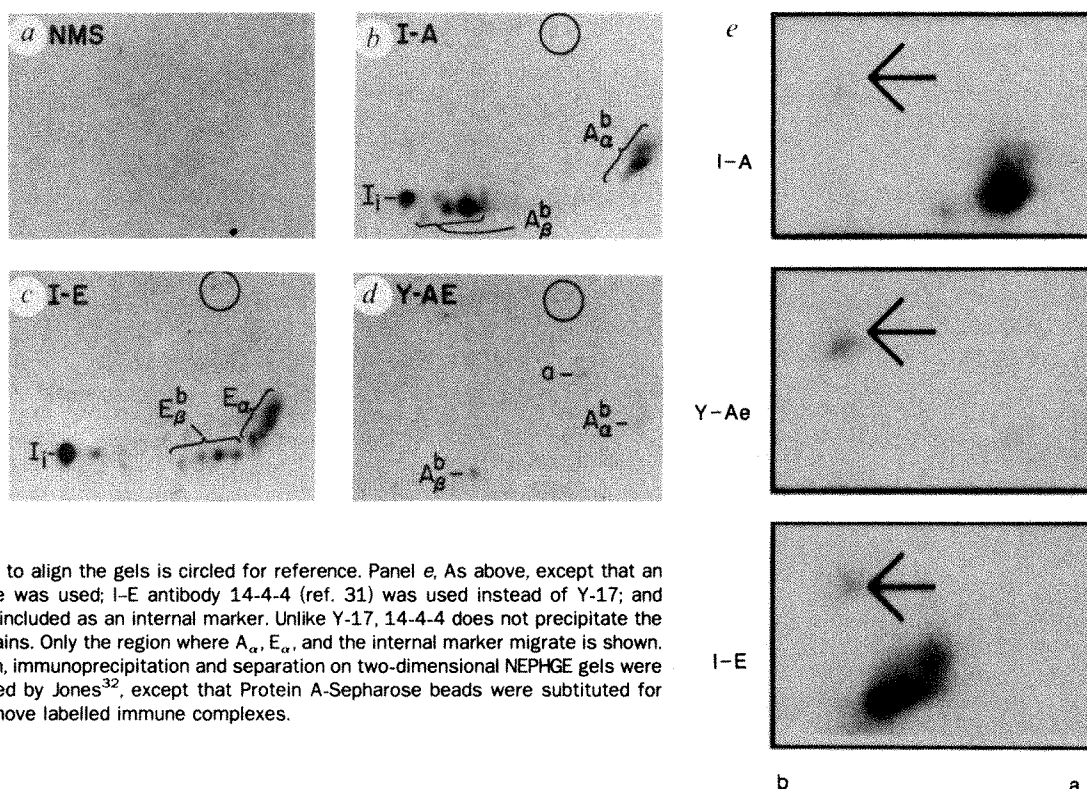

The epitope detected by Y-Ae on B cells is also strongly expressed on cells in the thymic medulla, but is not expressed on epithelial cells in the thymic cortex (Fig. 4). With both the B6-E<sub>α</sub> transgenic strain 107-1 and strain B10.A(5R) (data not shown), anti-I-A (Fig. 4a) and anti-I-E (Fig. 4b) antibodies give typical confluent staining of the medulla and reticular

staining buffer, cells were stained with FITC-Avidin for 20 min at 4 °C. Washed cells (20,000 per sample) were analysed on a FACS 440 (panels a, b, e-h) or a FACScan analyser (panels c, d). Cell number is displayed against a 3.7 log unit axis of fluorescence intensity.

**FIG. 2** The Y-Ae antibody reacts with mature forms of A<sub>α</sub> and A<sub>β</sub> chains. Panels a-d, two dimensional SDS-PAGE analysis of [<sup>35</sup>S]-methionine-labelled B10.A(5R) spleen cell lysates immunoprecipitated with normal mouse serum, anti-I-A (Y-3P), anti-I-E (Y-17) or Y-Ae. Note the identity but different intensity of the spots precipitated from the same lysate by Y-Ae and the major A<sub>α</sub> and A<sub>β</sub> spots precipitated by Y-3P; their distinction from all I-E spots precipitated by Y-17; and the absence of invariant chain (Ii) in the Y-Ae precipitate. A faint spot labelled (a) is actin. In the three immunoprecipitates, an

invariant triplet of spots used to align the gels is circled for reference. Panel e, As above, except that an independently prepared lysate was used; I-E antibody 14-4-4 (ref. 31) was used instead of Y-17; and <sup>14</sup>C-labelled OVA (arrow) was included as an internal marker. Unlike Y-17, 14-4-4 does not precipitate the most immature form of E<sub>α</sub> chains. Only the region where A<sub>α</sub>, E<sub>α</sub>, and the internal marker migrate is shown. **METHODS.** Labelling, extraction, immunoprecipitation and separation on two-dimensional NEPHGE gels were carried out exactly as specified by Jones<sup>32</sup>, except that Protein A-Sepharose beads were substituted for Staph A (Cowan strain) to remove labelled immune complexes.

staining of the cortex, whereas Y-Ae (Fig. 4c) reacts only with cells in the medulla. In contrast, the Y-Ae antibody does not react with any cells in the B6- $E^d$  transgenic strain 36-5 (Fig. 4f), which expresses I-A<sup>b</sup> molecules normally (Fig. 4d) and I-E<sup>b</sup> molecules on thymic epithelial cells only (Fig. 4e). This suggests that the Y-Ae epitope is expressed on bone marrow-derived cells in the thymic medulla.

Although it is clear that the Y-Ae antibody reacts with a subset of I-A molecules, and that an I-E gene influences the determinant recognized, the nature of the unique epitope detected is not yet known. We favour the interpretation that the antibody may be much like a T-cell receptor, detecting a self peptide: I-A complex. The most likely source of this peptide is the E<sub>α</sub> or E<sub>β</sub> chain. If the self-peptide: MHC model is correct, the antibody

will be extremely useful in analysing antigen processing at the molecular and ultrastructural levels. A second possibility is that the antibody reacts with a complex between I-A molecules and some intact protein whose expression is influenced by I-E molecules, such as the unknown products of *Mls* loci<sup>23</sup>. Other interpretations are also possible. To date, neither a processed peptide nor a third polypeptide chain has been detected by immunoprecipitation (Fig. 2).

The finding that a unique class II epitope is expressed on peripheral B cells and cells in the thymic medulla but not cortex is the first direct evidence that MHC molecules differ in conformation in a tissue-specific fashion. These results raise the possibility that the ligands involved in positive and negative selection of the T-cell repertoire may actually be different. If thymic

3 The Y-Ae antibody reacts with a subset of I-A<sup>b</sup> molecules on B10.A(5R) B cells. a, Unlabelled I-A<sup>b</sup> antibody Y-3P completely blocks binding of <sup>125</sup>I-labelled Y-Ae antibody to the B cell surface. b, Unlabelled Y-Ae partially inhibits binding of <sup>125</sup>I-labelled Y-3P. c, At saturation, the Y-Ae antibody binds at about 10% of the level obtained with Y-3P. d, The Y-Ae antibody binds with an avidity about 10-fold greater than that of Y-3P, as judged by Scatchard analysis. METHODS. T cells were depleted with anti-Thy-1 plus complement. Antibodies were <sup>125</sup>I-labelled, and binding assays carried out and analysed as previously described<sup>33</sup>, except that instead of washing extensively, cells were separated from unbound antibody by a single passage over oil-stop<sup>34</sup>.

FIG. 4 The Y-Ae antibody reacts with cells in thymic medulla but not cortex. Immunoperoxidase staining of frozen thymus sections shows the distribution of I-A (panels a, d), I-E (panels b, e), and the determinant detected by Y-Ae (panels c, f) in different B6- $E^d$  transgenic mice. Strain 107-1 (panels a, c) expresses I-E molecules normally, whereas in strain 36-5 (panels d-f), I-E molecules are expressed only on thymic epithelium (compare panels b and e). Y-Ae stains the thymic medulla in strain 107-1, but does not stain thymic cortex in either strain, despite the presence of strong staining with both anti-I-A and anti-I-E antibodies. This result is independent of the concentration of antibody used, and was also obtained with B10.A(5R) mice (data not shown). Neither anti-I-E nor Y-Ae antibodies stain above the background seen in panel f with thymus sections from progenitor B6 mice or B6- $E^d$  transgenic mice expressing I-E molecules only in the pancreas (data not shown).

METHODS. Cryostat sections (10  $\mu$ m) of thymus from strain 107-1 or strain

36-5 were fixed in acetone and hydrated in PBS. Primary biotinylated antibodies, diluted in PBS with 30 mg ml<sup>-1</sup> BSA, were layered over the sections for 30 min. Sections were washed in phosphate buffered saline, and the bound biotinylated antibodies were detected using avidin-HRP (ABC-Elite, Vector labs) with DAB as the chromogen. Magnification factor: ~60-100 $\times$ . The derivation and characterization of the transgenic mice is described in refs 10 and 11.

medullary cells are involved in negative selection by clonal deletion<sup>1-4</sup>, then one can envisage T-cell development as occurring sequentially, with cells being positively selected for recognition of one set of class II epitopes on thymic epithelium, followed by the deletion of cells cross-reactive with unique epitopes found in the thymic medulla and on peripheral cells. □

## Incubation time for AIDS from French transfusion-associated cases

D. Costagliola\*, J.-Y. Mary\*, N. Brouard†, A. Laporte‡ & A.-J. Valleron\*

\* INSERM U 263, Université Paris VII, 2 Place Jussieu, 75251 Paris Cedex 05, France

† INED, 27 rue du Commandeur, 75675 Paris Cedex 14, France

‡ Direction Générale de la Santé, Bureau 1C, 1 Place Fontenoy, 75700 Paris, France

ALTHOUGH incubation time is a key parameter of the epidemiology of AIDS, statistical estimates based on transfusion-associated AIDS cases have, up to now, used only the single dataset provided by the AIDS program of the Centers for Disease Control (CDC) in Atlanta. Using a new dataset provided by the Direction Générale de la Santé (DGS), of the French Ministry of Health<sup>1</sup>, we estimate the mean incubation time for AIDS (median in brackets) to be 5.3 years (5.3 years) with a 90% confidence interval ranging from 4.4 to 8.9 years (4.4 to 8.8 years), when a Weibull distribution is postulated for incubation time. The previously encountered problem of very large confidence intervals (range larger than 100 years)<sup>2</sup>, is no longer observed, indicating that an accurate estimate for mean incubation time will be obtainable in the near future.

In France, the country with the second highest incidence of

AIDS cases<sup>3</sup>, 259 transfusion-associated cases, diagnosed before January 1988 by WHO criteria<sup>4</sup>, had been reported to the DGS by 25 March 1988. (Reporting AIDS cases to the DGS is mandatory in France.) Each case was individually reviewed by an epidemiologist to verify the quality of the data reported. Ninety-two cases associated with multiple transfusion, single transfusion without knowledge of the time of transfusion or other major transmission risk factors (homosexual or bisexual men, haemophiliacs, intravenous drug users) were eliminated, leading to a dataset of 167 subjects<sup>1</sup>. Due to the age-dependence of incubation time<sup>5,6</sup>, the analysis was further restricted to all subjects 13 years of age or older. Thus, the final dataset used to estimate mean and median incubation times for AIDS, and to obtain confidence intervals for these two parameters, comprised 148 subjects.

To analyse the data, we used the classical maximum likelihood method for which two derivations of the likelihood function that are applicable to the present problem have been described. The approach described by Medley *et al.*<sup>5,6</sup> is conditional on only  $N$ , the total number of transfusion-associated cases observed and allows for an exponential growth in infected transfusions before 1985 and a constant number since then. The method used by Lui *et al.*<sup>7,8</sup> is conditional on  $N$  and on the times  $t_1, t_2, \dots, t_N$  of observed infections, and provides a truncated likelihood<sup>9</sup> and as the derivation of confidence intervals is easier with the approach described by Lui *et al.*, the latter method was selected. A Weibull or a  $\gamma$ -distribution for incubation time were postulated as in several previous works<sup>2,5-8</sup>. To derive confidence intervals for mean and median incubation times for AIDS, the

TABLE 1 Expected and observed numbers of transfusion-associated AIDS cases by year of transfusion and year of diagnosis

Year of diagnosis	Year of transfusion									Total
	1978	1979	1980	1981	1982	1983	1984	1985		
1982	0.1	0.0	0.1	0.0	0.0	(expected)	1.0			0.2
	1	0	0	0	0	(observed)				1
1983	0.2	0.0	0.3	0.3	0.1	0.0				0.9
	0	0	0	1	0	0				1
1984	0.2	0.0	0.5	0.8	1.4	0.4	0.0			3.3
	0	0	0	0	3	2	0			5
1985	0.2	0.0	0.7	1.5	3.8	3.5	1.5	0.0		11.2
	0	0	1	1	2	2	3	0		9
1986	0.1	0.0	0.8	2.1	7.1	9.9	14.4	2.5		36.9
	0	0	2	2	3	17	18	3		45
1987	0.0	0.0	0.6	2.2	9.6	18.2	40.1	24.5		95.2
	0	0	0	3	14	11	35	24		87

The expected numbers are calculated using the Weibull distribution for incubation time.

likelihood ratio statistics (LRS), accepted as the best method in cases where data are truncated<sup>10</sup>, was used. Using a Weibull distribution, our point estimate for the mean (median) incubation time is 5.3 years (5.3 years). The 90% confidence interval is 4.4–8.9 years (4.4–8.8 years). The corresponding results with a  $\gamma$ -distribution are 6.9 years for the mean (6.4 years for the median) with a 90% confidence interval ranging from 4.9–19.0 years (4.6–17.1 years). An adjustment of the Weibull distribution to the data is presented in Table 1. Not surprisingly, the  $\chi^2$  value of comparison of the expected and observed values is not significant ( $\chi^2 = 7.0$ , 3 d.d.f.). A similar fit was observed with a  $\gamma$ -distribution, for the log of the likelihood value (see legend to Fig. 1), even if the confidence intervals for this distribution seem to be larger.

To compare our results with the most recent results obtained from the US dataset (by the method of Medley *et al.*<sup>11</sup>), the US data were analysed using the method described above<sup>7,8</sup>. The 543 cases reported to CDC by 8 April 1988, on the same selection criteria as for the French dataset, were included in the analysis. Our estimate of the mean, as compared with the last published analysis from Medley *et al.*<sup>11</sup>, was 7.3 years (90% confidence interval 5.7–11.7 years) versus 7.6 years, with a Weibull distribution and 9.8 years (90% confidence interval 7.1–19.0 years) versus 24.1 years with a  $\gamma$ -distribution. A large discrepancy between the results obtained by the two different methods is observed only when a  $\gamma$ -distribution is postulated. This distribution, however, was rejected by Medley *et al.*<sup>11</sup>, due to the very large annual rate of infective transfusions after 1985 that is predicted with their model with the  $\gamma$ -assumption. Moreover, the same authors now estimate<sup>12</sup> the mean incubation time at 14.3 years ( $\gamma$ -distribution), based on the April 1988 CDC data analysis. Unfortunately the authors do not comment on the sharp decrease (around 10 years) in their estimate.

The sizes of our confidence intervals seem relatively small compared with those reported by Kalbfleisch *et al.* (4.6,  $\infty$ ; ref. 2). Our explanation is that the precision of the estimate of the mean (or median) incubation time is related to the duration of the follow-up rather than to the number of subjects. To investigate this hypothesis, the French and US cases diagnosed before 1 January 1987 (61 and 388 cases, respectively) were analysed

using the Weibull distribution. This led, respectively, to a 90% confidence interval for the mean of (4.4,  $\infty$ ) and (5.7,  $\infty$ ).

In conclusion, when assuming a Weibull distribution for incubation time, the mean or median incubation time estimated from the French dataset, range from 4.4–8.9 years (90% confidence intervals). The evolution of the range of confidence intervals for the mean incubation time over the past year, clearly shows that reasonably narrow confidence intervals will be obtainable in the near future  $\square$

## Paramyxovirus SV5 and multiple sclerosis

Bodvar Vandvik & Erling Norrby\*

Institute of Immunology and Rheumatology, Rikshospitalet National Hospital, University of Oslo School of Medicine, Fredrikke Quams gt. 1c, Oslo 1, Norway

\* Institute of Virology, Karolinska Institutet School of Medicine, Stockholm, Sweden

MULTIPLE sclerosis is commonly associated with a local humoral immune response within the central nervous system. A hallmark of this intrathecal response is the presence of electrophoretically demonstrable oligoclonal bands of IgG in the cerebrospinal fluid (CSF) of up to 95% of patients<sup>1,2</sup>. Observations indicating that a major part of the CSF IgG in some patients may represent antibodies to SV5, a simian virus closely related to human parainfluenza type 2 virus, were recently reported by Goswami *et al.*<sup>3</sup>. We have studied thirty patients with multiple sclerosis, but although we find intrathecal synthesis of IgG antibodies reacting with SV5 in seven of these, the antibodies were not associated with oligoclonal CSF IgG bands and could in each case be explained as potentially cross-reacting antibodies to other paramyxoviruses known to be human pathogens. We have therefore been unable to confirm that SV5 may be a major intrathecal immunogen in multiple sclerosis.

Sera and CSF from thirty multiple sclerosis (MS) patients were analysed for IgG antibodies to SV5 and seven other viral antigens using an imprint immuno-fixation (IIF)<sup>4</sup> technique. In agreement with other reports<sup>5–7</sup>, intrathecal antibody responses to one or more viruses were observed in all thirty patients, seven of whom had intrathecal synthesis of antibodies reacting with SV5 (Fig. 1, Table 1). No evidence of intrathecal SV5 antibody synthesis was observed in six patients with defined neuroinfectious diseases (SSPE, HSV encephalitis, VSV encephalitis, tuberculous meningitis, Lyme neuroborreliosis, neurosyphilis) or in ten patients with neuroinflammatory diseases of undetermined aetiology.

Oligoclonal IgG bands were demonstrated by agarose gel electrophoresis and by IIF in the CSF from twenty-nine of the MS patients, including six of the seven with intrathecal SV5 antibody synthesis (Table 2). But the patterns of these bands did not correlate with those of intrathecally synthesized anti-

FIG. 1 The estimated incubation time described by Weibull distribution or  $\gamma$ -distribution shown as a proportion of transfusion-associated AIDS cases diagnosed before a given point in time. The 148 patients, 13 years of age or older, diagnosed before 1 January 1988 and reported to DGS by 25 March 1988 were included in the analysis. The density function according to the Weibull distribution is  $pq^p x^{p-1} e^{-(qx)^p}$ , where  $p$  and  $q$  are parameters, and  $x$  is the time between transfusion and diagnosis, the fitted parameters are  $p = 3.23$  and  $q = 0.17$  and the log likelihood is  $-509.203$ . The  $\gamma$ -distribution has the density function  $q^p x^{p-1} e^{-qx} / \Gamma(p)$ , the fitted parameters are  $p = 4.47$  and  $q = 0.65$  and the log likelihood is  $-508.596$ . The first parts of the curves were adjusted on the DGS dataset for up to 6.4 years (observed data) and then extrapolated from the model of the density function.

FIG.1 Imprint immunofixation (IIF) of total IgG and of IgG antibodies to SV5, parainfluenza (PF) viruses 2 and 3, mumps (Mu), measles (Me), varicella zoster (VZV) and cytomegalovirus (CMV) in electrofocussed (pH 3.5-9.5) pairs of serum and CSF from three patients with MS. Individual autoradiographs show serum above and CSF below. Note intrathecal synthesis of antibodies to SV5 and other viruses in each of the three patients (for criteria, see below) and of oligoclonal IgG bands (triangles) in two of the patients.

METHODS. SV5 (LN strain), PF2 (Greer strain), PF3 (C 243 strain) and mumps (Enders strain) cell pack antigens were prepared from infected Vero (African green monkey kidney) cell cultures. The infected cells were suspended in phosphate buffered saline at a concentration of ~10% (v/v), sonicated, and clarified by centrifugation (1,000 g for 5 min). Control antigen was prepared from non-infected Vero cells in the same way. Measles, HSV, VZV and CMV antigens were prepared as described previously<sup>7</sup>. Sera and concentrated CSF were adjusted to an IgG concentration of 2 g/dl. The procedure used for IIF has been described elsewhere<sup>4</sup>. The autoradiographs were evaluated visually. Fractions or 'bands' of IgG or of viral IgG antibodies in the CSF which had no, or clearly less intensely stained counterparts, in matching serum were concluded to derive from intrathecal synthesis.

bodies to SV5 or any of the other viruses (Figs 1, 2) and did not provide evidence that the oligoclonal IgG bands reacted with SV5.

The seven patients with intrathecal SV5 antibody synthesis generally had a higher number of intrathecally synthesized virus antibody specificities than those without, and each had intrathecal synthesis of antibodies to at least two of three other (PF2, PF3, mumps) paramyxoviruses (Table 2). In each case, a close correspondence was seen between CSF patterns of SV5 antibodies and antibodies to PF2 (5 patients) or mumps (2 patients) (Figs 1 and 2), suggesting cross-reacting activities between these antibodies. This was confirmed by virus absorption<sup>7</sup> of two selected CSF specimens, the first showing corresponding patterns of SV5 and PF2 antibodies and the second

of SV5 and mumps antibodies. Three separate 50  $\mu$ l aliquots of concentrated CSF (IgG concentration 1 g l<sup>-1</sup>) from each of the two patients were absorbed with 250  $\mu$ l SV5, PF2, or mumps antigen preparations respectively, and analysed by IIF (data not shown). SV5 antibodies were removed after absorption with SV5 and PF2, but not with mumps antigen, in the first specimen, and after absorption with SV5 and mumps but not with PF2 in the second. The IIF patterns of other viral (measles, HSV) antibodies and of oligoclonal IgG bands in the absorbed specimens were essentially unchanged. The removal of oligoclonal IgG bands after absorption with SV5, reported by Goswami *et al.*<sup>3</sup> in eight out of twelve patients, was therefore not confirmed here.

Using monoclonal antibodies, Randall *et al.* recently reported

FIG. 2 Comparison of patterns of total IgG and viral antibodies in sera and CSF from two of the patients shown in Fig. 1. The specimens were electrofocused in a pH 6.5–9.5 gradient in order to provide better separation of IgG than in the pH 3.5–9.5 gradient shown in Fig. 1. Methods and symbols are otherwise as in Fig. 1. Note the difference in patterns between intrathecally synthesized SV5-IgG antibodies and bands of oligoclonal IgG (triangles) in both patients, and the correspondence between these antibodies and intrathecally synthesized antibodies to PF2 (case JO) or mumps (case OS).

the presence of cross-reacting epitopes on at least three virus structural proteins of SV5 and PF2, but not on the hemagglutinin-neuraminidase (HN) protein, which was unique to each virus<sup>8</sup>. Five of the monoclonal antibodies to SV5 HN used in this study (provided by Professor W. C. Russell) were analysed by IIF. Each reacted strongly with SV5 none reacted with PF2, showing that our method could readily detect antibodies to the SV5 HN protein. We conclude that methodological limitations do not explain the failure to detect antibodies reacting selectively with SV5 in the MS patients we studied.

In conclusion, our results suggest that there is no association between oligoclonal CSF IgG bands and SV5-specific antibodies in MS patients. The intrathecal synthesis of multiple viral antibodies constituting a minor fraction of the CSF IgG is generally thought to reflect a non-specific activation of B cells within the CNS, and is unlikely to be of aetiological importance. The oligoclonal IgG bands, however, represent a major fraction of the intrathecally synthesized immunoglobulin and may be recognizing major intrathecal immunogens involved in MS. Defining their specificity therefore remains a highly important challenge. □

## Cloning of human telomeres by complementation in yeast

Sally H. Cross, Robin C. Allshire, Stewart J. McKay, Nio I. McGill & Howard J. Cooke

MRC Human Genetics Unit, Western General Hospital, Crewe Road, Edinburgh EH4 2XU, UK

TELOMERES confer stability on chromosomes by protecting them from degradation and recombination and by allowing complete replication of the end<sup>1</sup>. They are genetically important as they define the ends of the linkage map. Telomeres of lower eukaryotes contain short repeats consisting of a G-rich and a C-rich strand, the G-rich strand running 5'–3' towards the telomere and extending at the end<sup>2–11</sup>. Telomeres of human chromosomes share characteristics with those of lower eukaryotes<sup>12,13</sup>, including sequence similarity as detected by cross-hybridization<sup>14–16</sup>. Telomeric repeats from many organisms can provide telomere function in yeast<sup>2,17</sup>. Here we describe a modified yeast artificial chromosome (YAC) vector with only one telomere which we used to clone human telomeres by complementation in yeast. YACs containing human telomeres were identified by hybridization to an oligonucleotide of the trypanosome telomeric repeat. A subcloned human fragment from one such YAC is immediately subtelomeric on at least one human chromosome.

Human DNA digested with restriction enzymes which have four base-pair (bp) recognition sequences displays a range of fragments which hybridize to oligonucleotides containing the trypanosome telomeric repeat sequence TTAGGG. In the case of *Sau3A*, this range of fragments is centred at about 10 kilobases (kb) in DNA isolated from peripheral blood cells. These fragments are lost after brief digestion of intact DNA with

FIG. 1 Cloning of human sequences in pYAC4-Neo-Not. pYAC4-Neo<sup>16</sup> was cut to completion with *Bam*HI and partially with *Xho*I. The adaptor sequence 5'-TCGAGGGATCCGCGGCCG-3', base-paired with 15 of 19 bases, and having TCGA and GATC unpaired at the 5' ends, was ligated as described<sup>28</sup>. The adaptor destroys the original *Bam*HI site and recreates the *Xho*I site. The *his3* gene and one of the tetrahymena telomeric repeats (TTAGGG)<sub>n</sub> in pYAC4-Neo are deleted. A *Not*I restriction site is introduced adjacent to the remaining tetrahymena telomeric repeat and a *Bam*HI site between the *Not*I and *Xho*I sites. The structure shown was confirmed by restriction site mapping. Human placental DNA between 5 and 15 kb after *Sau3A* digestion was recovered from an agarose gel and ligated to pYAC4-Neo-Not which had been digested with *Not*I, dephosphorylated and digested with *Bam*HI. This DNA was used to transform AB1380 spheroplasts.

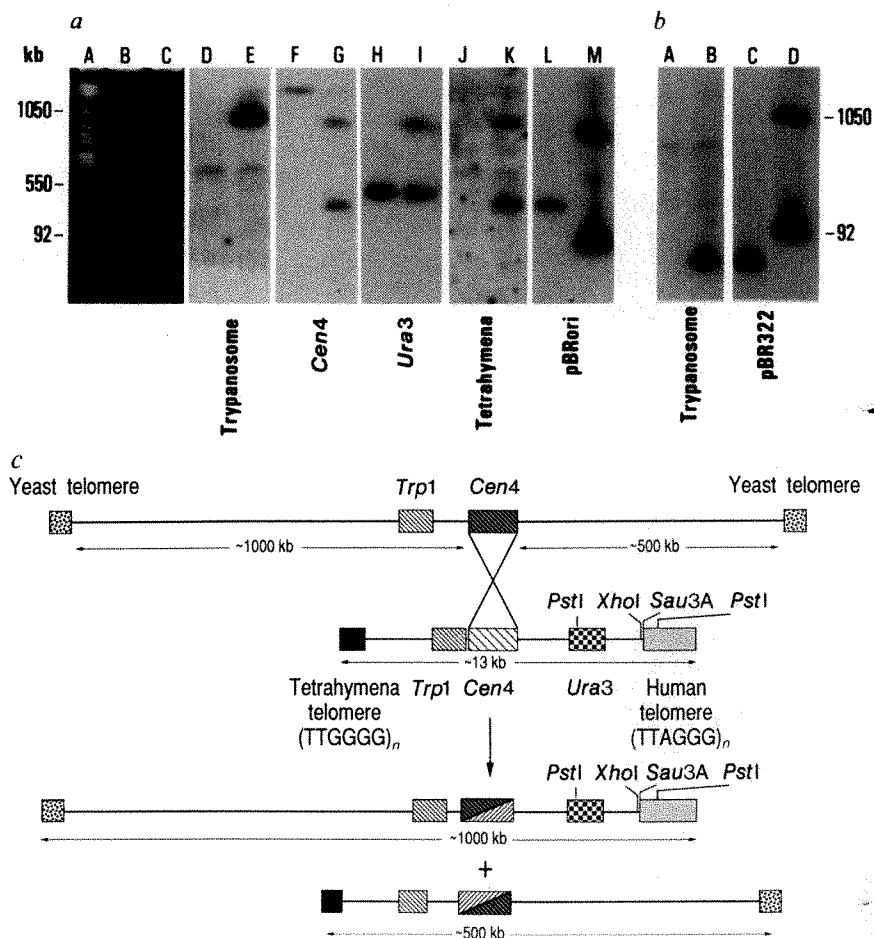

exonuclease *Bal31* (ref. 15). We have modified a YAC vector pYAC4 Neo (ref. 18) to give a vector (pYAC4-Neo-Not) which requires the addition of a second sequence with telomere function for its maintenance as a linear minichromosome in yeast. The presence of the *sup4* gene in the vector provides a colour test for the maintenance of this marker; AB1380 (ref. 19) yeast colonies are red in the absence and white in the presence of this gene. Details of the vector are given in the legend to Fig. 1. *Sau3A*-digested placental DNA from 5–15 kb was used as an enriched source of human telomeres for ligation to pYAC4-Neo-Not digested with *NotI* and *BamHI*.

AB1380 was transformed<sup>20</sup> with the ligation mix and selected for *Ura*<sup>+</sup> transformants. *Ura*<sup>+</sup> transformants (240) were screened for the presence of human telomeric sequences on the basis of colony hybridization to the oligonucleotide (TTAGGG)<sub>4</sub>. Two strongly hybridizing positive colonies were found (Hutel 1 and Hutel 22). Pulsed-field gel electrophoresis (PFG) comparison of AB1380 and Hutel 1 chromosomes showed that in this recombinant the 1.5 megabase (Mb) yeast chromosome 4 was replaced by two new chromosomes of 1.0 and 0.5 Mb respectively (Fig. 2a). Hybridization analysis shows that these chromosomes are the product of recombination between the transforming molecule and yeast chromosome 4 (Fig. 2a, c). In the case of Hutel 22, PFG analysis showed the presence of a 12-kb linear artificial chromosome, as shown in Fig. 2b. When plated on non-selective media, a high proportion of colonies were red as we expected, because a linear chromosome of this size should be relatively unstable<sup>21</sup>. In contrast, Hutel 1 gave less than 5 per cent red colonies when plated on non-selective media (data not shown).

FIG. 2 Novel yeast chromosomes with human telomeres. a, Hutel 1 and AB1380 analysed by pulsed field gel electrophoresis. A–C, ethidium bromide stained gel; D and E, probed with (TTAGGG)<sub>4</sub>; F and G, probed with a yeast *cen4* DNA fragment; H and I, probed with yeast *ura3*; J and K, probed with (TTGGGG)<sub>4</sub>; L and M, probed with pBR *ori* probe (*PvuII*–*PstI*). A and M, yeast marker chromosomes; B, D, F, H and J, AB1380; C, E, G, I, K and L, Hutel 1. The larger of the novel chromosomes hybridized to (TTAGGG)<sub>4</sub> and to *ura3*. Both novel chromosomes hybridized to a *cen4* probe and the smaller chromosome hybridized with the *ori* region of pBR322 and the tetrahymena telomere oligonucleotide probe (TTGGGG)<sub>4</sub>. Restriction analysis of Hutel 1 DNA showed that endogenous fragments were retained unchanged in size for the *trp1* and *ura3* genes, but that vector and endogenous *cen4* fragments were changed in size (data not shown). Homologous recombination between the *cen4* region of the vector and the original chromosome 4 would give rise to these chromosomes as detailed (Fig. 2c). b, Hutel 22 and AB1380 analysed by pulsed field gel electrophoresis. A and B probed with (TTAGGG)<sub>4</sub>; C and D probed with pBR322. A, AB1380; B and C, Hutel 22; D, YP148 marker chromosomes. Yeast DNAs were prepared in agarose plugs as described<sup>29</sup>. They were run on a 1% agarose gel overnight using a waltzer apparatus. The gel was made and run in 0.25 × TBE (0.089 M Tris, 0.089 M boric acid, 0.002 M EDTA). Conditions were 7 V cm<sup>-1</sup> at 10 °C and 90° between 120° reorientations. The gel was blotted to Hybond-N and hybridized with the <sup>32</sup>P-labelled probes as listed above. Hybridization with random primed fragments was overnight at 68 °C in 7% SDS, 0.5 M Na<sub>2</sub>HPO<sub>4</sub>, pH 7.2, 0.5% dried milk powder. Filters were washed in 0.1 × SSC, 0.1% SDS at 65 °C. Hybridization with oligonucleotides was overnight at 50 °C in 0.1% SDS, 0.1% sodium pyrophosphate, 0.05% bovine serum albumin, 0.05% polyvinylpyrrolidone, 0.05% Ficoll, 5 × SSC. Filters were washed in 4 × SSC, 0.1% SDS at 65 °C. Size markers (kb) are indicated. c, Recombination between

We wished to know if the human sequences in Hutel 1 and Hutel 22 were present at the end of the new yeast chromosomes. First, the end of a DNA molecule presents as an apparent site for all restriction enzymes. Such a site was present at the distal end of the region of human DNA homologous to the (TTAGGG)<sub>4</sub> oligonucleotide probe for both Hutel 1 and Hutel 22 (data not shown). Two additional features should be exhibited by terminal restriction fragments with human homology. They should be decreased in size and eventually become undetectable when intact recombinant yeast DNA is digested with exonuclease *Bal31*. Second, these terminal fragments should be heterogeneous in size when compared with fragments of the genome which are bounded by two restriction sites<sup>22</sup>. Figure 3 shows that both of these criteria are satisfied for Hutel 1. We consider that the most likely explanation for this heterogeneity is the addition of yeast terminal repeats. We conclude that Hutel 1 and Hutel 22 contain human DNA fragments with homology to trypanosome telomeric repeats and that these sequences support telomere function in a yeast.

Although >95 per cent of sequences which hybridize (TTAGGG)<sub>4</sub> are *Bal31*-sensitive in intact human DNA<sup>22</sup>, hence presumably telomeric or closely subtelomeric, it was important to show that the human sequences that we cloned in yeast are telomeric in the human genome. We have cloned some of the human sequences from Hutel 1 into a plasmid (pHutel 1), as described in the legend to Fig. 4. This cloned DNA fragment has no homology to the (TTAGGG)<sub>n</sub> terminal repeats detectable by hybridization or by sequence analysis (data not shown). When hybridized to blots of human DNA treated with *Bal31* for different times and then digested with *Sau3A*, this

endogenous and artificial chromosomes. Restriction sites relevant to the chromosome construction and subcloning are indicated. Figure is not to scale.

probe detected *Bal*31-sensitive fragments which were the same size as those detected by a (TTAGGG)<sub>4</sub> oligonucleotide probe (Fig. 4a). In addition, a number of discrete fragments are detected which do not correspond in size to fragments detected by the (TTAGGG)<sub>4</sub> probe. When hybridized to digests of blood and sperm DNA from different individuals, pHut1 DNA detected heterogeneous smears which were the same size as those detected by the oligonucleotide (TTAGGG)<sub>4</sub> and which were larger in sperm than in blood DNAs (Fig. 4b). This size

difference between these tissues from a single individual is a characteristic of the human pseudoautosomal telomeres<sup>13</sup>. From the restriction map presented in Fig. 2, we would predict that this probe would not detect heterogeneous fragments in a *Pst*I digest of human DNA. As shown in Fig. 4b, only discrete bands are detected in *Pst*I digests by pHut1. We conclude that this sequence must be immediately subtelomeric in the human genome.

Telomeres of all organisms studied consist of short tandemly

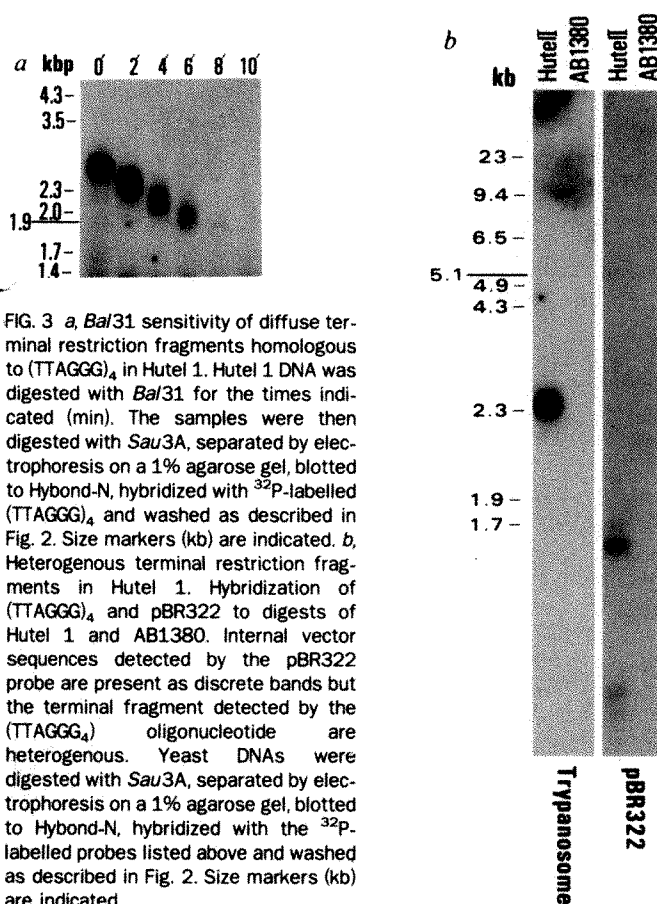

FIG. 3 a, *Bal*31 sensitivity of diffuse terminal restriction fragments homologous to (TTAGGG)<sub>4</sub> in Hutel 1. Hutel 1 DNA was digested with *Bal*31 for the times indicated (min). The samples were then digested with *Sau*3A, separated by electrophoresis on a 1% agarose gel, blotted to Hybond-N, hybridized with <sup>32</sup>P-labelled (TTAGGG)<sub>4</sub> and washed as described in Fig. 2. Size markers (kb) are indicated. b, Heterogenous terminal restriction fragments in Hutel 1. Hybridization of (TTAGGG)<sub>4</sub> and pBR322 to digests of Hutel 1 and AB1380. Internal vector sequences detected by the pBR322 probe are present as discrete bands but the terminal fragment detected by the (TTAGGG)<sub>4</sub> oligonucleotide are heterogenous. Yeast DNAs were digested with *Sau*3A, separated by electrophoresis on a 1% agarose gel, blotted to Hybond-N, hybridized with the <sup>32</sup>P-labelled probes listed above and washed as described in Fig. 2. Size markers (kb) are indicated.

FIG. 4 Terminal location of pHut1 human sequences in the human genome. The human sequence in Hutel 1 was restriction mapped and a *Pst*I site proximal to the terminal repeats was found which, in the recombinant, lies on a *Pst*I fragment which also contains part of the yeast marker *ura3*. This fragment (pHut1) was recovered from a *Pst*I library of Hutel 1 in pTZ 19 using a *ura3* DNA fragment as a probe. a, Human placental DNA was digested with *Bal*31 for the times indicated (min). The samples were then split and digested with *Sau*3A or *Pst*I, separated by electrophoresis on 0.8% agarose gels and blotted to Hybond-N. The filter with the *Bal*31 series digested with *Sau*3A was first hybridized with <sup>32</sup>P-labelled *Xho*I-*Pst*I fragment containing human sequences from pHut1 and washed as described in Fig. 2. The filter was then stripped as recommended by the manufacturers, hybridized with <sup>32</sup>P-labelled (TTAGGG)<sub>4</sub> and washed as described in Fig. 2. The filter with the *Bal*31 series digested with *Pst*I was hybridized with <sup>32</sup>P-labelled pSS166 (*Hind*III fragment from cosmid B4 (ref. 30)). Hybridization was at 60 °C, but otherwise as described in Fig. 2. The filter was washed in 2 × SSC, 0.1% SDS at 65 °C. O, Gel origin; marker sizes are given in kb. b, Blood and sperm DNAs from the same individual were digested with *Sau*3A or *Pst*I, separated by electrophoresis on a 0.8% agarose gel, blotted to Hybond-N and hybridized with the <sup>32</sup>P-labelled probes as indicated. Hybridization and washing conditions were as described in Fig. 1. Size markers (kb) are indicated; O, gel origin.

repeated sequences. Variation in copy number of these repeats results in the heterogeneity observed for terminal restriction fragments<sup>23,24</sup>. In yeast the terminal repeats are the only elements required for telomere function<sup>22</sup>, and telomeric repeats from a number of organisms are capable of function in yeast by the addition of yeast sequences. Previous data<sup>12-15</sup> suggested that human telomeres showed many of the structural features of telomeres of lower eukaryotes. We have shown here that a telomeric fragment of human DNA can function as a telomere in yeast, suggesting that the structure of the ends of human chromosomes conforms to the general model of a number of short tandem repeats with a G-rich strand and a C-rich strand: the G-rich strand runs 5'-3' towards the end of the molecule and ends in a short single-strand extension. This degree of conservation and cross-kingdom function may reflect some similarities of replication mechanisms and protein interaction at the chromatin level. In other organisms there are proteins which interact specifically with the telomeres<sup>24,25</sup>. Alternatively, these sequences may themselves form functionally significant structures. G-G base pairing has been detected in tetrahymena telomeric sequences<sup>26</sup> and there may also be a requirement for the ability to form a four-stranded parallel base-paired structure in meiosis<sup>27</sup>.

Cloning of human telomeres in yeast provides a powerful method of obtaining markers at the ends of the physical and genetic maps of the human genome. Linkage of these markers to distal markers on the human linkage map will define the length of this map. □

## Molecular cloning of human telomeres in yeast

William R. A. Brown

Biochemistry Department, Oxford University, South Parks Road, Oxford OX1 3QU, UK

**TELOMERES** are the DNA sequences found at the ends of linear chromosomes. They define the boundaries of the genetical and physical maps of such chromosomes and so are particularly important for the complete mapping of large genomes that is now being attempted. Telomeres have been intensively studied in the yeast *Saccharomyces cerevisiae* and in ciliated protozoa<sup>1</sup>: in these organisms the telomeric DNA consists of arrays of tandemly repeated short sequences in which one strand is guanosine-rich and oriented 5' to 3' towards the chromosome end. The conservation of these structural features is reflected in the observation that telomeric DNA from a variety of protozoa will function as telomeres on artificial linear mini-chromosomes in yeast<sup>1,2</sup>. Tandem arrays of the sequence TTAGGG have been identified at the telomeres of humans and other mammals<sup>3</sup> and also of trypanosomes<sup>4</sup>. This indicates that the structural features of telomeres are conserved between higher and lower eukaryotes and implies that human telomeric DNA could function in yeast. I have used this idea to develop a strategy to isolate a specific human telomere as a molecular clone in yeast and have devised a simple and effective way of cloning other human telomeres and their associated sequences.

Human telomeres contain the sequence (TTAGGG)<sub>n</sub>. This sequence is identical to the most prominent components of both the  $\alpha$ -satellite DNA of guinea pig<sup>5</sup> and the HS- $\alpha$ -satellite of DNA of kangaroo rat<sup>6</sup>. These satellite DNA sequences can be purified from the bulk of the genomic DNA by isopycnic centrifugation on a Cs<sub>2</sub>SO<sub>4</sub> gradient in the presence of silver ions, so human telomeric DNA could possibly be similarly purified. Accordingly, I restricted human placental DNA with *Bam*HI and fractionated it on such a gradient. Hybridization analysis (Fig. 1a) using the oligonucleotide probe (TTAGGG)<sub>4</sub> revealed

ACKNOWLEDGEMENTS. We thank those who donated blood and sperm; C. Greider and J. Inglis for oligonucleotides; N. Davidson, S. Bruce and D. Stewart for photographic work and Professor H. J. Evans for encouragement and support. S.H.C. is supported by an SERC studentship.

that the telomeric DNA had been separated from the bulk of the genomic DNA. Fractions enriched in the sequence (TTAGGG)<sub>n</sub> were pooled and their enrichment with respect to the unfractionated DNA was calculated after gel electrophoresis, filter transfer and hybridization analysis (Fig. 1b). Densitometry indicated that these sequences had been enriched sevenfold with respect to the bulk of the genomic DNA.

The pseudoautosomal region of the human sex chromosomes includes a telomere. Sequences originating about 25 kilobase pairs (kb) from this telomere have been isolated as molecular clones in bacteria<sup>7</sup>. One of the sequences, 29cl, lies on the telomeric *Bam*HI fragment. I used this *Bam*HI fragment as a model to test whether a human telomere could function in the yeast *S. cerevisiae* by constructing a vector, pTV2 (Fig. 2a), for cloning telomeres in yeast. Digestion of this molecule with *Bam*HI and *Not*I generates two fragments: at one end of the larger is a sequence (denoted in Fig. 2a by 'TEL') that is derived from the ribosomal DNA of *Tetrahymena thermophila*<sup>8</sup> and which can function as a telomere in yeast, and at the other is a *Bam*HI site which could act as a cloning site. This molecule possesses only a single telomere and thus cannot autonomously function as a linear molecule in yeast cells. But if the telomere from the pseudoautosomal region can function as a telomere in yeast, then ligation of the *Bam*HI fragment (defined by 29cl) to the appropriately cut pTV2 will generate a molecule capable of autonomous linear existence in yeast. Accordingly, the telomere-enriched, *Bam*HI-cut DNA from the Ag<sup>+</sup>/Cs<sub>2</sub>SO<sub>4</sub> gradient was ligated to vector DNA cut with *Not*I and *Bam*HI and introduced into yeast. This generated ~2,600 transformants. (An undefined proportion of these transformants contain circular molecules derived from the large *Bam*HI/*Not*I fragment of pTV2 by illicit intramolecular ligation within the yeast, hence the complexity of the potential telomere library is as yet unknown.) The transformants were then divided into ten pools which were individually amplified and screened for the 29cl sequence by colony hybridization. Two pools each originating from the same transformation plate contained hybridizing colonies. These were isolated and examined for the presence of a linear mini-chromosome of the appropriate structure by digestion with restriction enzymes and pulsed-field gel electro-

FIG. 1 Enrichment of human telomeric DNA by isopycnic ultracentrifugation on  $\text{Ag}^+/\text{Cs}_2\text{SO}_4$  gradient. *a*, Spectrophotometric and hybridization analysis of fractions from the gradient. *b*, Hybridization analysis of DNA enriched for telomeric sequences.

**METHODS.** *a*, A solution of *Bam*HI-digested placental DNA (1.2 ml) at  $1.0 \text{ mg ml}^{-1}$  in  $0.1 \text{ M Na}_2\text{SO}_4$ ,  $0.1 \text{ M}$  borate buffer,  $\text{pH } 9.2$ , was slowly mixed with  $16.2 \text{ mM AgClO}_4$  to give a silver:phosphate molar ratio of  $0.2$ . This was added to a solution of  $\text{Cs}_2\text{SO}_4$  (density  $1.566 \text{ g ml}^{-1}$ ) in  $0.1 \text{ M Na}_2\text{SO}_4$  to give a final volume of  $24.7 \text{ ml}$ , a borate concentration of  $0.05 \text{ M}$  and a density of  $1.5 \text{ g ml}^{-1}$ . The mixture was centrifuged at  $50,000 \text{ r.p.m.}$  for  $50 \text{ h}$  in a Beckman VTi rotor. After centrifugation, the tube was pierced and  $0.24 \text{ ml}$  fractions collected from the bottom. Fractions were monitored spectrophotometrically and by dot-blot filter hybridization using a  $(\text{TTAGGG})_4$  probe. The hybridization and washing were carried out as described<sup>9</sup> at  $50^\circ\text{C}$ . The  $(\text{TTAGGG})_n$  sequence detected by this probe banded between  $1.55$  and  $1.53 \text{ g ml}^{-1}$ , which is consistent with the results obtained for guinea pig  $\alpha$ -satellite DNA<sup>10</sup>. *b*,  $5 \mu\text{g}$  human male *Bam*HI-digested placental DNA or  $0.7 \mu\text{g}$  telomere-enriched, *Bam*HI-digested DNA were electrophoresed on an  $18 \text{ cm}$ ,  $0.6\%$  agarose gel for  $16 \text{ h}$  at  $1.5 \text{ V cm}^{-1}$ . The gel was stained with ethidium bromide and photographed under ultraviolet light (left panel) and then filter-transferred and analysed with the  $(\text{TTAGGG})_4$  probe as described above (right panel).

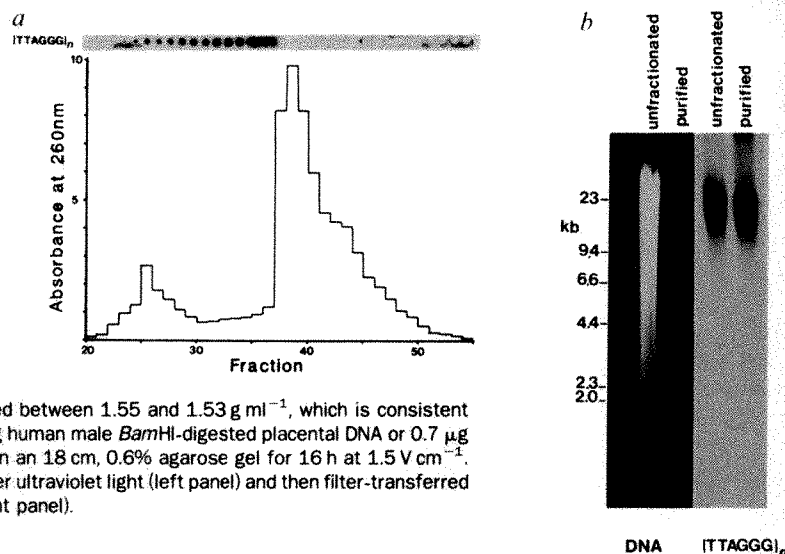

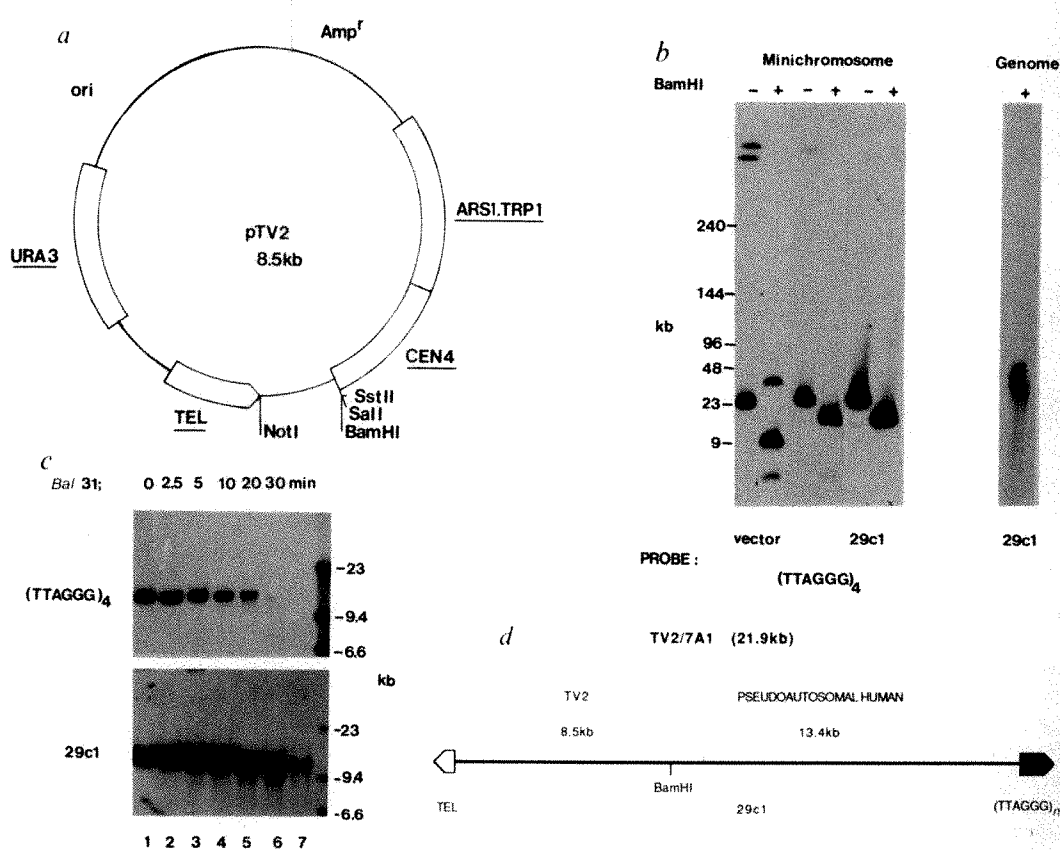

FIG. 2 Molecular cloning of the telomere from the human pseudoautosomal region and mapping of a minichromosome containing this telomere. *a*, Structure of pTV2. *b*, Restriction site analysis of the minichromosome TV2/7A1 containing the human pseudoautosomal telomere. *c*, Digestion with *Bal*31 and *Bam*HI reveal the relative orientation of 29c1 and  $(\text{TTAGGG})_n$  in TV2/7A1. *d*, Molecular map of TV2/7A1.

**METHODS.** *a*, pTV2 was constructed in *E. coli* from pYAC4<sup>11</sup>, a polylinker containing a *Not*I site and a polylinker containing *Bam*HI, *Sal*I and *Sst*II sites, using standard techniques. The vector and construction details are available on request. *b*, Telomere-enriched DNA ( $67 \mu\text{g}$ ) was prepared as described in the legend to Fig. 1 and ligated to  $25 \mu\text{g}$  dephosphorylated *Bam*HI-, *Not*I-cut pTV2 in  $300 \mu\text{l}$ . Unligated vector was removed from the ligation mix by preparative gel electrophoresis in low-gelling-temperature agarose (Seakem). Agarose containing the target DNA that was ligated to vector was melted and digested with Agarase (Calbiochem). The digest was extracted with phenol, then with chloroform and dialysed against  $0.01 \text{ M Tris.HCl}$ ,  $0.001 \text{ M EDTA}$ ,  $\text{pH } 7.4$ , and concentrated to  $300 \mu\text{l}$  by vacuum dialysis. The ligated DNA was then introduced into *S. cerevisiae* strain AB1380<sup>12</sup> by spheroplast transformation<sup>12</sup>. The transformants were selected on medium lacking uracil and collected in ten pools of  $\sim 200$  clones, then  $\sim 10,000$  cells from each pool were plated on to  $20 \text{ cm}$ -square Hybond-N membranes and screened by colony hybridization<sup>13,14</sup> using the 29c1 probe. Single colonies containing cognate DNA were then grown and used to prepare DNA in agarose plugs<sup>15</sup>. DNA from one clone that contained the minichromosome TV2/7A1 was analysed by pulsed-field gel electrophoresis<sup>16</sup> and filter-hybridization, either with (+) or without (-) prior *Bam*HI digestion. For comparative purposes, the *Bam*HI-digested male placental DNA ( $10 \mu\text{g}$ ) was run on the same gel. The probes used in the hybridization analysis were either the large *Xho*I-*Xho*I fragment of pYAC4 (vector), the oligonucleotide  $(\text{TTAGGG})_4$ , or 29c1. The 29c1 and the vector probes were used as described previously<sup>17</sup>. *c*, Agarose plugs containing  $\sim 1 \mu\text{g}$  yeast genomic DNA and the mini-chromosome TV2/7A1 in  $0.04 \text{ ml}$  were digested at  $30^\circ\text{C}$  for the time indicated with  $0.5$  units of *Bal*31 (BRL) in  $0.07 \text{ ml}$ . The digest

was stopped by adding  $1 \text{ ml}$   $0.02 \text{ M EGTA}$ ,  $0.01 \text{ M Tris.HCl}$ ,  $0.001 \text{ M EDTA}$ ,  $\text{pH } 7.4$ . After  $20 \text{ min}$ , the plug was rinsed in water, gelatin, salts and dithiothreitol as appropriate, and the DNA digested to completion with *Bam*HI. Before loading on to a  $0.8\%$  agarose gel the plugs were rinsed in  $10 \text{ mM Tris.HCl}$ ,  $1 \text{ mM EDTA}$ ,  $\text{pH } 7.4$ , and melted. The gels were ethidium bromide-stained and photographed under ultraviolet light to reveal the absence of any detectable endonuclease activity in the *Bal*31. They were then filter-transferred and analysed with the probes indicated, as described above. No DNA was loaded into track 7 of either gel, but in the gel shown in the lower panel, molten agarose leaked from track 6 into track 7 to give rise to hybridizing material in this track. Track 8 of each panel includes end-labelled *Hind*III fragments of phage  $\lambda$  DNA as size markers. *d*, When an exogenous telomere is introduced into yeast, it acts as the substrate for a terminal transferase that adds telomeric repeats which are characteristic of yeast to the pre-existing G-rich repeat<sup>18,19</sup>. The novel array characteristic of yeast typically extends for only a few hundred base pairs and is not illustrated on this map.

FIG. 3 Mini-chromosomes containing candidate human telomeres. The amplified population of transformants described in the legend to Fig. 2b was screened with the oligonucleotide (TTAGGG)<sub>4</sub>; clones that hybridized to this probe, but not to the 29cl sequence, were picked, cultured and used to prepare high-molecular weight DNA. These DNA samples were then analysed (tracks 2-9), together with that from the clone containing TV2/7A1 (track 1), by pulsed-field gel electrophoresis and filter-hybridization with the (TTAGGG)<sub>4</sub> probe. The two members of each pair of clones that migrate with identical mobility originate from distinct cloning events.

phoresis. They all contained a 22-kb molecule which is absent from the host strain and which hybridized to 29cl. The structure of the molecule, TV2/7A1, in cells derived from one colony was examined in more detail (Fig. 2b). TV2/7A1 hybridized to vector DNA, to 29cl and to the oligonucleotide (TTAGGG)<sub>4</sub> (Fig. 2b). *Bam*HI cleaved the molecule into two fragments whose sizes summed to that of the uncut minichromosome. One fragment of ~9 kb contained vector sequences (Fig. 2b), the other fragment of 13.4 kb contained the 29cl and (TTAGGG)<sub>4</sub> sequences (Fig. 2b). (In addition to the pTV2-derived fragment there are fragments in the *Bam*HI digest which hybridize to the vector; these result from hybridization to host genomic fragments.) If the (TTAGGG)<sub>n</sub> sequence on the pseudoautosomal fragment in the mini-chromosome has been recognized as a telomere by the yeast, then it should be susceptible to the action of the exonuclease *Bal*31. The 29cl sequence, on the other hand, should lie in the middle of the molecule and be relatively resistant to the action of this exonuclease. These predictions were tested by digesting DNA containing the mini-chromosome for progressively increasing lengths of time with *Bal*31, cutting with *Bam*HI, followed by Southern blotting and filter hybridization using either the (TTAGGG)<sub>4</sub> probe (Fig. 2c, upper panel) or the 29cl probe (Fig. 2c, lower panel). These results are summarized in the map in Fig. 2d. Sizing of the fragments produced by the action of *Bal*31 and *Bam*HI indicates that the (TTAGGG)<sub>n</sub> array extends for only 1.2 kb at the end of this mini-chromosome. But in human placental DNA, the sizes of the arrays with this sequence range from 9 kb to 20 kb (unpublished observations, and ref. 3). It thus seems likely that the (TTAGGG)<sub>n</sub> sequence is being abbreviated during the cloning procedure. This could be a consequence of the way in which the human telomere is healed in the yeast, although some exogenous tandemly repeated sequences are unstable in yeast artificial chromosome cloning vectors in a way that is reminiscent of their instability in *Escherichia coli* plasmid and phage vectors (C. Tyler-Smith and A. Villasante, personal communication). It is possible that such instability is contributing to the loss of these sequences from the chimaeric mini-chromosome. The observation (Fig. 2b) that the pseudoautosomal probe 29cl recognized a 30 kb fragment

in the *Bam*HI-cut placental DNA used for cloning is consistent with this explanation, although little is known about the structure of human proterminal DNA and more complex rearrangements could have occurred in the course of the cloning experiment. Further mapping experiments will resolve this point.

The observation that the pseudoautosomal telomere can function as a telomere in yeast and contains the sequence (TTAGGG)<sub>n</sub> indicates that other transformants in the pTV2 *Bam*HI-fragment library with this sequence could contain linear minichromosomes. I investigated this prediction by screening the amplified library with a (TTAGGG)<sub>4</sub> probe. Eight additional independent clones identified in this way were colony-purified and analysed by pulsed-field gel electrophoresis (Fig. 3). Each clone contains a minichromosome which includes (TTAGGG)<sub>n</sub>. The electrophoretic behaviour of these molecules indicated that they were probably linear and were between 10 and 200 kb long. Although there may be blocks of the (TTAGGG)<sub>n</sub> array elsewhere in the genome, it is reasonable to regard these molecules as candidates for novel unmapped human telomeres.

These results demonstrate a simple and novel strategy for isolating human telomeres and their flanking sequences. This will allow analysis of the structure and function of human proterminal DNA and will define the limits of the human genome map. In light of the evolutionary conservation of the distinctive structural and functional characteristics of telomeric DNA, the approaches described here could be applicable to a wide variety of organisms. □

ACKNOWLEDGEMENTS. I thank Ed Southern for suggesting the use of Ag<sup>+</sup>/Cs<sub>2</sub>SO<sub>4</sub> gradients, Chris Tyler-Smith for comments on the manuscript, Alan Coulson and others for advice on molecular cloning in yeast. I am particularly grateful to Alfredo Villasante for establishing yeast molecular cloning in this laboratory. This work was supported by the CRC.

## Identification of the electron transfers in cytochrome oxidase that are coupled to proton-pumping

Mårten Wikström

Department of Medical Chemistry, University of Helsinki, Siltavuorenpenger 10A, SF-00170 Helsinki, Finland

**MITOCHONDRIAL cytochrome oxidase is a functionally complex, membrane-bound respiratory enzyme which catalyses both the reduction of O<sub>2</sub> to water and proton-pumping. During respiration, an exogenous donor, cytochrome c, donates four electrons to O<sub>2</sub> bound at the bimetallic haem a<sub>3</sub> Fe-Cu centre within the enzyme. These four electron transfers are mediated by the enzyme's haem a and Cu<sub>A</sub> redox centres and result in the translocation of four**

protons across the inner mitochondrial membrane.<sup>1</sup> The molecular mechanism of proton translocation has not yet been delineated, however, and in the absence of direct experimental evidence all four electron transfers have been assumed to couple equally to proton-pumping. Here, I report the effects of proton-motive force and membrane potential on two equilibria involving intermediates of the bimetallic centre at different levels of O<sub>2</sub> reduction.<sup>2-7</sup> The results show that only two of the electron transfers, to the 'peroxy' and 'oxyferryl' intermediates of the bimetallic centre, are linked to proton translocation, a finding which strongly constrains candidate mechanisms for proton-pumping.

The assumption that all four electron transfers from cytochrome *c* to O<sub>2</sub> bound to the bimetallic centre are equally coupled to proton-pumping (Fig. 1a) was tested by determining the linkage of two of the one-electron transfer reactions (Fig. 1b, box I) to proton and charge translocation. This was made possible by the observation that the catalytic cycle of the bimetallic centre can be driven in reverse, with discrete oxidation of intermediate O to F, and further to P, and concomitant reversed electron transfer to cytochrome *c*<sup>5-7</sup>. In isolated mitochondria, intermediates O, F and P can be brought in near equilibrium with cytochrome *c* (redox-poised with ferri-/ferrocyanide) by a proton-motive force across the membrane. Thus, the dependence of the P/F and F/O redox equilibria on proton-motive force and membrane potential ( $\Delta\psi$ ), at constant pH and redox potential of cytochrome *c*, provided information on the coupling of each electron transfer reaction to proton and charge translocation.

Figure 2 shows the dependence of the F/O and P/F redox equilibria on phosphorylation potential. Proton-motive force is generated by ATP hydrolysis which is catalysed by the mitochondrial H<sup>+</sup>-ATPase. The data indicate that electron transfer from cytochrome *c* to P, and to F, is coupled to the synthesis of 0.9–1.0 and 0.7–0.75 ATP molecules, respectively. This means that 1.6–1.75 ATP molecules are formed by oxidative phosphorylation coupled to the transfer of two electrons from cytochrome *c* to reduce P to O (through F). This 'local' ATP/2e<sup>-</sup> ratio is nearly twice that of overall cytochrome *c* oxidase activity<sup>8</sup>. It follows that the electron transfers from cytochrome *c* to P and to F constitute the main energy-conservation steps in the catalytic cycle of cytochrome oxidase. By contrast, the two remaining electron transfers, from cytochrome *c* to O and to H (Fig. 1b) make only a small contribution to ATP synthesis, which may be limited to the electrogenicity of electron transfer from cytochrome *c* to the bimetallic centre (Fig. 1a).

A quantitative evaluation of the linkage of the P/F and F/O reactions to proton and charge translocation requires a knowledge of the number of protons translocated per hydrolysed extramitochondrial ATP. At present an H<sup>+</sup>/ATP ratio of 4 is widely accepted<sup>9</sup>. From Fig. 2 it therefore follows that the P/F and F/O transitions are coupled to the overall translocation of 3.6–4.0 and 2.8–3.0 H<sup>+</sup>, respectively. It should be noted, however, that two events other than proton-pumping are electrogenic in the oxidase reaction (Fig. 1a). The first is electron transfer between cytochrome *c* and the binuclear centre; the

second is the uptake of the protons from the inside of the inner mitochondrial membrane that are consumed in reduction of O<sub>2</sub> to water<sup>10</sup>.

Table 1 summarizes the quantitative analysis of the results shown in Fig. 2, from which it can be concluded that both the P/F and the F/O transition are coupled to the pumping of close to 2 H<sup>+</sup>.

Figure 3 shows the dependence of the F/O equilibrium on electrical membrane potential at high pH, where the intermedi-

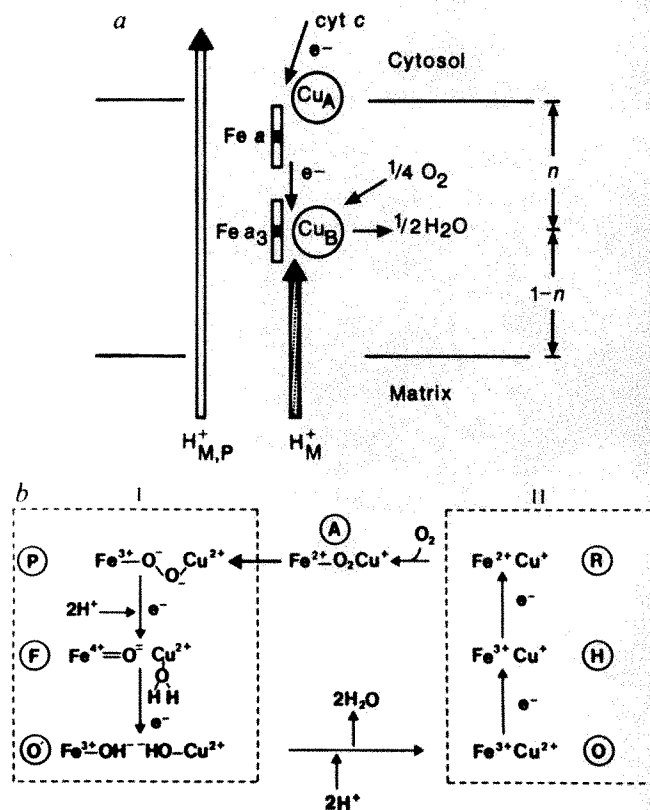

FIG. 1 a, Electrogenic reactions of cytochrome oxidase. Each electron transferred from cytochrome *c*, through haem *a* (Fe *a*) and Cu<sub>A</sub>, to the bimetallic haem *a*<sub>3</sub> (Fe *a*<sub>3</sub>)-Cu<sub>B</sub> centre, and reduction of O<sub>2</sub> to water, is accompanied by the uptake of 1 H<sup>+</sup> from the matrix phase for the formation of water (shaded arrow), and the pumping of 1 H<sup>+</sup> across the membrane (white arrow). The fraction of the total transmembrane dielectric traversed by electron transfer from cytochrome *c* to the bimetallic centre is denoted by *n*. Proton uptake to the centre traverses the fraction (1 - *n*). b, Proposed catalytic scheme of O<sub>2</sub> reduction by the bimetallic centre. Fe and Cu denote the iron of haem *a*<sub>3</sub> and Cu<sub>B</sub>, respectively. The main intermediates previously observed spectroscopically are shown. O and O' are not distinguishable by optical spectroscopy, but by the pH-dependence of the O → F transition. Uptake of H<sup>+</sup> corresponds to H<sub>M</sub><sup>+</sup> in a. Proton-pumping is not shown. Dashed boxes labelled I and II outline the parts of the cycle that are here proposed to be coupled and not coupled to proton-pumping, respectively. Further details are described in refs 5–7, 10.

TABLE 1 Calculation of the H<sup>+</sup>/e<sup>-</sup> ratio of proton-pumping

Reaction step	H <sup>+</sup> uptake in reaction H <sub>M</sub> <sup>+</sup>	Charge translocated in reaction q <sup>+</sup>	Observed total H <sup>+</sup> translocated H <sub>obs</sub> <sup>+</sup>	H <sup>+</sup> pumped H <sub>M,P</sub> <sup>+</sup>	Charge pumped q <sub>P</sub> <sup>+</sup>
F → O (pH 7.2)	1	1	2.8–3.0	1.8–2.0	1.8–2.0
P → F (pH 8.3)	2	1.5	3.6–4.0	1.6–2.0	2.1–2.5

H<sub>M</sub><sup>+</sup> is the number of H<sup>+</sup> taken up from the matrix side of the membrane at the indicated pH, excluding proton-pumping, as determined previously<sup>7</sup> (see Fig. 1a, b). q<sup>+</sup> is the number of electrical charge equivalents translocated, excluding proton-pumping, linked to the corresponding reaction, and assuming *n* = 0.5 (Fig. 1a). H<sub>obs</sub><sup>+</sup> denotes the observed total number of H<sup>+</sup> translocated (Fig. 2), assuming a H<sup>+</sup>/ATP ratio of 4. H<sub>M,P</sub><sup>+</sup> is the number of H<sup>+</sup> taken up from the matrix side due to proton-pumping alone (Fig. 1a), obtained as H<sub>obs</sub><sup>+</sup> - H<sub>M</sub><sup>+</sup>. q<sub>P</sub><sup>+</sup> is the number of electrical charge equivalents translocated due to proton-pumping alone, obtained as H<sub>obs</sub><sup>+</sup> - q<sup>+</sup>. Due to inequivalency of q<sup>+</sup> and H<sub>M</sub><sup>+</sup>, and the dominance of the  $\Delta\psi$  term over the  $\Delta\text{pH}$  term of the proton-motive force, H<sub>M,P</sub><sup>+</sup> underestimates, and q<sub>P</sub><sup>+</sup> overestimates the H<sup>+</sup> pump stoichiometry for the P → F transition.

ate O' dominates over O (ref. 7) (Fig. 1b) so that the only linked electrogenic event expected apart from proton-pumping is electron transfer to cytochrome *c*. The 27-mV dependence observed indicates that the oxidation of O' to F by cytochrome *c* is coupled to the translocation of  $\sim 2.2$  (60 mV/27 mV) charge equivalents. Subtraction of the fraction due to electron transfer (see legend to Table 1 and Fig. 1a) yields 1.7 charges translocated by proton-pumping, in accordance with the data in Table 1.

This work shows that the four electron transfers from cytochrome *c* to the bimetallic centre (Fig. 1) are non-equivalent with respect to coupling to proton-pumping. The steps reducing the 'peroxy' and 'oxyferryl' intermediates are probably each coupled to translocation of 2 H<sup>+</sup>, whereas the two other electron transfers of the catalytic cycle (Fig. 1b, box II) are not coupled to proton-pumping.

It is generally assumed that each electron is transferred equivalently from cytochrome *c* first to the Cu<sub>A</sub> and haem *a* redox centres, and then to the bimetallic centre. With respect to the latter, however, the four electron transfers are non-equivalent (Fig. 1b), suggesting that neither Cu<sub>A</sub> nor haem *a* can *a priori* have primary mechanistic roles in proton-pumping. Instead, it seems that the bimetallic centre is itself critically involved in the mechanism. There are, however, two alternative possibilities by which either Cu<sub>A</sub> or haem *a* could play a part in proton-pumping without excluding the bimetallic centre. First, it is conceivable that either Cu<sub>A</sub> or haem *a* might specifically carry electrons from cytochrome *c* to P and F, but not to O or H, although there is no experimental support for this at present. Second, there might be some co-operativity between Cu<sub>A</sub> or haem *a* with the bimetallic centre. The latter has been demonstrated, whereas interactions with Cu<sub>A</sub> are small or non-existent<sup>11-14</sup>. Haem *a* could thus have a specific configuration when oxygen is bound to the bimetallic centre (states P and F), and could therefore be mechanistically involved in proton-pumping<sup>15,16</sup>.

The observed 'mechanistic' 2 H<sup>+</sup>/e<sup>-</sup> ratio in itself obviously constrains possible mechanisms of proton-pumping. Interestingly, proton-pumping by bacteriorhodopsin has the same stoichiometry per photocycle. Here the mechanism includes

FIG. 2 Dependence of the P/F (A) and F/O (B) equilibria on phosphorylation potential. Rat liver mitochondria (0.77  $\mu$ M cytochrome *aa*<sub>3</sub>) were suspended in 0.2 M sucrose-20 mM KCl-20 mM HEPES-Tris buffer in the presence of 3  $\mu$ M rotenone, 0.25  $\mu$ g ml<sup>-1</sup> antimycin, 5  $\mu$ M myxothiazol, 0.75 mM EGTA and 0.96 mM potassium phosphate. Reaction temperature, 25°. In A, 1.5 mM potassium ferricyanide was also present (pH 8.3). In B, 1.5 mM each of potassium ferricyanide and ferrocyanide were present (pH 7.2). Varying amounts of ADP and ATP were added in different incubations, and the corresponding concentrations of P, F, and O determined by deconvolution<sup>7</sup> of spectroscopic data at 583 and 607 nm, with 630 nm as reference. The straight lines are derived from a linear regression analysis of the data. The slopes (varying between 0.9 and 1 for A and between 0.70 and 0.75 for B in different experiments) indicate the number of ATP molecules hydrolysed per molecular event.

FIG. 3 Dependence of the F/O equilibrium on membrane potential. Rat liver mitochondria were suspended in 0.25 M sucrose-20 mM HEPES-Tris buffer at pH 8.3, in the presence of rotenone, antimycin, myxothiazol and EGTA (see Fig. 2), and 1.5 mM sodium ferricyanide. After 15 s 0.4  $\mu$ g ml<sup>-1</sup> of valinomycin was added, and  $\Delta\psi$  recorded as described for Fig. 2. KCl was added at different concentrations to vary  $\Delta\psi$ . Without added KCl the extramitochondrial K<sup>+</sup> concentration was 1 mM after adding valinomycin (as measured potentiometrically). Much of this K<sup>+</sup> stems from the intramitochondrial space and part stems from the buffer used to isolate the mitochondria. The amounts of F and O were determined at each potential, as described for Fig. 2; in these conditions only negligible amounts of P were formed.  $\Delta\psi$  was estimated from the Nernst equation, assuming 120 mM intramitochondrial K<sup>+</sup>. Linear regression analysis gave the line of best fit shown.

active participation of both the chromophore and acidic amino-acid residues in the apoprotein<sup>17</sup>. Directly coupled mechanisms, which typically involve the redox centres, the substrates and the products<sup>18-21</sup>, are more strongly circumscribed by the H<sup>+</sup>/e<sup>-</sup> ratio of 2 than are indirect mechanisms with essential contributions from the protein structure. This is not only because it is easier, at present, to explicitly describe directly coupled mechanisms chemically, but also because direct coupling of two-proton transfer to one-electron transfer is less common in biological chemistry. Yet, such coupling does exist, as exemplified by the superoxide/hydrogen peroxide redox couple at physiological pH.

are you well informed?*

# The definitive text on PCR technology from the people who developed it . . .

## **PCR Technology**

### **Principles and Applications for DNA Amplification**

Edited by **H. Erlich, Ph.D.**, Cetus Corporation, Emeryville, CA

PCR (Polymerase Chain Reaction) technology is a revolutionary technique which enables scientists to rapidly generate large amounts of genetic material from a slight trace which would otherwise be too small to analyze. With applications in both research and diagnostics, PCR will soon become a standard procedure in biotechnology and medical diagnostic laboratories. **PCR Technology: Principles and Applications for DNA Amplification** is an introduction and practical guide to the technology. Written by the pioneers in the field, this is the authoritative publication detailing the methodology and the wide range of applications of PCR technology in basic research, medicine, evolutionary studies and forensics.

July 1989, approx. 176 pp., softcover 0-333-48948-9 £15.95

The first volume in the series: Breakthroughs in Molecular Biology

*Also from Macmillan*

## **Lymphokines**

### **The Molecular Biology of Regulators of Immune and Inflammatory Responses**

By **K.-I. Arai**, and **J. de Vries**, DNAX Research Institute, Palo Alto, CA

A thorough synthesis of the research including information on the complete isolation, structure and function of all the major lymphokines.

Tentative publication date: November 1989, softcover 0-333-49785-6 £25.00 (tentative)

## **Electromanipulation in Hybridoma Technology**

Edited by **C. Borrebaeck**, University of Lund, Sweden and **I. Hagen**, Center for Industrial Research, Oslo, Norway

A practical, how-to manual that details the techniques of electrofusion and electroporation.

Tentative publication date: November 1989, softcover £27.95 (tentative)

## **Signal Transduction in Biological Systems**

By **Y. Kaziro**, University of Tokyo, Japan, and **K.-I. Arai**, DNAX Research Institute, Palo Alto, CA

A comprehensive treatment of diverse biological phenomena through the application of general principles of signal transduction.

Tentative publication date: 1990, softcover £23.95 (tentative)

**THE AGA KHAN UNIVERSITY**

Faculty of Health Sciences  
Medical College

The Aga Khan University is now in its sixth year of operation. Its affiliated Aga Khan University Hospital has well equipped teaching and service laboratories and will have 654 beds when fully operational. The University and the University Hospital are autonomous, privately-funded and philanthropic institutions committed to the provision of effective health professional education and health services relevant to Pakistan and the region.

Applications are invited from highly committed professionals for the following key positions in our **Microbiology Department**:

### ASSOCIATE PROFESSOR

Candidates applying for this position must have an M.B.B.S. and M.R.C. Path or equivalent qualifications, preferably with experience in a Clinical Microbiology laboratory. Candidates having experience of teaching in a Medical College; routine diagnostic services and medical research will be given preference.

The current research work in the Microbiology Department focuses on the Immunology of Mycobacterial diseases and the candidates are encouraged to develop their own areas of interest.

### ASSISTANT PROFESSOR

Candidates applying for this position must have a Ph.D. in Microbiology or related subject with experience in Bacteriology/Virology will be preferred. The incumbent will be required to participate in teaching and research activities.

Salary and benefits will be offered commensurate with qualifications, experience and level of responsibility. Candidates intending to pursue a career in Pakistan are preferred. If you are seeking professional growth and an excellent environment, please send your detailed résumé, bibliography and names of at least three referees familiar with recent work history to the **Personnel Manager, The Aga Khan University, P.O. Box 3500, Stadium Road, Karachi-74800, Pakistan.**

(W6098)A

## MEMORIAL UNIVERSITY OF NEWFOUNDLAND DEPARTMENT OF BIOCHEMISTRY PHYSICAL BIOCHEMISTRY

The Department of Biochemistry, Memorial University of Newfoundland, St. John's, Newfoundland, invites applications from qualified individuals for a tenure-track faculty position effective October 1, 1989. Applicants should have an interest in research and teaching in physical biochemistry or protein structural chemistry or both. Applicants should have a Ph.D. and productive postdoctoral experience if appointed at the Assistant Professor rank, and a proven record of independent research if appointed at the Associate Professor or Professor rank. The successful candidate will be required to establish a strong independent research program and to undertake undergraduate and graduate teaching. Applicants should submit a *curriculum vitae* and names of three referees to **Dr. K.M.W. Keough, Head, Department of Biochemistry, Memorial University of Newfoundland, St. John's, Newfoundland, Canada, A1B 3X9**, before August 1, 1989.

In accordance with Canadian Immigration policy, consideration, in the first instance, will be given to Canadian citizens and permanent residents of Canada. Others are encouraged to apply and will be considered. (NW3660)A

## UNIVERSITY OF WATERLOO GROUNDWATER RESEARCH

The Waterloo Centre for Groundwater Research (a Centre of Excellence funded by the Government of Ontario) is seeking applications for a research position in Environmental Biochemistry/Microbiology.

The appointment will be at the University of Waterloo at a professorial rank dependent upon qualifications and experience for a term of five years contingent upon continued funding. The successful applicant will work as part of a multidisciplinary team involved in research on aspects of groundwater contamination and will develop a research program with major support obtained from industry and government agencies. A candidate with a Ph.D. degree in an area of biochemistry or microbiology with applications to biochemical studies of biodegradation and biotransformation of organic compounds in groundwater will be given preference.

The closing date for applications is upon appointment of a suitable candidate. The appointment will be effective July 1st 1989 or as soon as possible after that date. With permission of Employment and Immigration Canada, competition is open to Canadian citizens, permanent residents and non-Canadians. Please send a complete *curriculum vitae* and the names, addresses and telephone numbers of three referees to **D.J.A. Smyth, Manager, Waterloo Centre for Groundwater Research, University of Waterloo, Waterloo, Ontario, Canada N2L 3G1.** (NW3642)A

**unilever  
research**
**COLWORTH LABORATORY  
SHARNBROOK, BEDFORD**

## SKIN DELIVERY RESEARCH

Colworth Laboratory, located 9 miles north of Bedford, is a major food and biotechnology research centre supporting the worldwide business interests of the Unilever organization.

A vacancy has arisen for a suitably qualified post-doctoral scientist to lead research into the delivery of molecules through the skin. This is a challenging opportunity to seek fundamental understanding of delivery mechanisms and apply this knowledge to the development of improved topical formulations.

The position requires the ability to work in a multi-disciplinary team and candidates should have a background in biochemistry or pharmacology with a good working knowledge of chemistry. One to two years post-doctoral experience would be an advantage.

Salary will be according to the qualifications and experience offered. Fringe benefits are those typical of a large multinational concern, and relocation assistance is given where necessary.

Please write or telephone for an application form to:

**Recruitment Officer (S),  
UNILEVER RESEARCH,  
Colworth Laboratory,  
Sharnbrook,  
Bedford MK44 1LQ.**

## University of Birmingham

### LECTURESHIPS IN EXPERIMENTAL PHYSICS

The University wishes to make three appointments to lectureships under the New Academic Appointments Scheme. These are for experimentalists to work in the following fields:

Solar and Stellar Seismology (Professor G R Isaak)	--ref PH4312
Environmental/Biomedical Physics (Dr T D Beyon)	--ref PH4313
Chemical Physics (Professor D Smith, FRS)	--ref PH4314

These research areas are being accorded high priority by the School and University because of notable recent advances made in them at Birmingham and because of their considerable potential for future development. It is hoped that the persons appointed will take up their posts on or before 1 October 1989. The salary will be in the Lecturer A/B range (£9,260-£19,310, subject to review) plus superannuation.

For further particulars of the above posts and an application form, telephone 021-414 6383 quoting the appropriate reference number. Applications (3 copies) should be sent to the **Senior Assistant Registrar, Faculty of Science, PO Box 363, Birmingham B15 2TT** by 31 May 1989.

*AN EQUAL OPPORTUNITIES EMPLOYER* (9072)A

## UNIVERSITY OF BRISTOL DEPARTMENT OF ANIMAL HUSBANDRY

### POST DOCTORAL MICROBIOLOGIST/AEROBIOLOGIST

Required to study the fate of pathogenic bacteria following aerosolisation and inhalation using both *in vivo* and *in vitro* techniques. Applicants should be qualified in microbiology and have interests in infectious disease and aerobiology. The post is funded for three years.

Salary is dependent upon age and experience within the range 1A £9865-£15720 p.a.

For further details telephone Bristol 303136 (ansaphone after 5.00 p.m.) or write to the **Personnel Office, Senate House, Bristol BS8 1TH**. Please quote reference A356.

The closing date is 12th May 1989.

(9075)A

## CHIEF, LABORATORY OF MOLECULAR GENETICS

### NATIONAL INSTITUTES OF HEALTH

#### PUBLIC HEALTH SERVICE

#### DEPARTMENT OF HEALTH AND HUMAN SERVICES

The Intramural Research Program of the National Institute on Aging (NIA), Baltimore, Maryland invites nominations and applications for the position of Chief, Laboratory of Molecular Genetics. This is a Civil Service Position with a salary range of \$57,158 to \$74,303 per annum depending upon qualifications. Candidates may be eligible for Physician's Comparability Allowance up to \$20,000 per year. Alternatively, candidates may be eligible for appointment in the Commissioned Corps of the U.S. Public Health Service.

The Chief of the Laboratory of Molecular Genetics is responsible for planning, directing and conducting research programs which use molecular and genetic approaches to the study of aging and related processes; for recruiting staff and providing professional leadership for senior staff in their projects; and for originating, designing, and conducting independent and collaborative research on age and disease related alterations in the structure and regulation of genes.

Applicants must have a Doctoral degree with a record of outstanding scientific accomplishment in the field of Molecular Genetics. In addition, applicants should possess qualifications that demonstrate competence in executive level management and leadership ability.

Further information may be obtained by contacting Ms. Barbara Hughes at (301) 550-1733. An Application for Federal Employment (SF-171) with a current curriculum vitae and bibliography should be submitted to:

**Personnel Office, Gerontology  
Research Center  
National Institute on Aging  
4940 Eastern Avenue  
Baltimore, Maryland 21224.**

**APPLICATIONS MUST BE POSTMARKED NO  
LATER THAN MAY 31, 1989.**

All qualified candidates will receive consideration without regard to race, religion, color, sex, age, national origin, lawful political affiliation, marital status, union membership, or nondisqualifying physical or mental handicap.

U.S. Citizenship is required.

NIH IS AN EQUAL OPPORTUNITY EMPLOYER

(NW3636)A

**Murdoch  
University**

PERTH  
WESTERN AUSTRALIA

## CHAIR IN PLANT SCIENCES

Applications are invited for the Chair in Plant Sciences within the Biological Science Programme at Murdoch University. This Chair will become vacant at the end of 1989 on the retirement of Professor J.F. Loneragan, the Foundation Professor. The School of Biological and Environmental Sciences offers an integrated undergraduate degree in Biological Sciences and has demonstrated strengths in basic and strategic research. Within the Plant Sciences, current research activities include phycology, mineral nutrition and tissue culture, reinforced by complementary activities in Horticultural Science, Biotechnology, Environmental Science and Microbiology.

Agreement was recently reached between Murdoch University and The University of Western Australia to seek a merger of the two institutions by January 1990.

Applicants, who may belong to any area of plant sciences, are expected to have an international research reputation including a strong record of external research support, a proven ability for leadership and a commitment to teaching. (Ref: 0010)

**SALARY:** \$A63,919 per annum.

Conditions of appointment include superannuation, long service leave, access to outside studies programmes, payment of fares to Perth for appointee and dependant family, removal and settling-in allowances.

There is no prescribed application form. Applicants are invited to submit a full curriculum vitae supported by an appropriate letter including the names and addresses of three referees.

Applications and requests for further information should be sent to:

**The Chief Personnel Officer  
Murdoch University  
MURDOCH WESTERN AUSTRALIA 6150**

**Telephone: (619) 332 2283**

Applications will close on 2 June 1989.

Applicants resident in the United Kingdom, Europe or Africa, may obtain supporting statements from and should lodge one copy of any application with:

**The Secretary General  
Association of Commonwealth Universities  
36 Gordon Square  
LONDON WC1H 0PF UNITED KINGDOM**

**MURDOCH UNIVERSITY IS AN  
EQUAL OPPORTUNITY EMPLOYER**

(W6086)A

## UNIVERSITY OF LEICESTER Department of Biochemistry and Biological NMR Centre

### Postdoctoral Research Associates and Technician

Positions are available for two postdoctoral research associates and a technician in an expanding group studying the structure and interactions of gene regulatory DNA-binding proteins by high-resolution NMR spectroscopy. Members of both the helix-turn-helix and "Zinc finger" classes of DNA-binding proteins are currently being studied. One of the *postdoctoral positions* would be suitable for a person with experience of two-dimensional nmr spectroscopy, preferably of proteins, and the second for someone with a background in molecular biology and/or protein-DNA interactions and an interest in structural studies.

The *research technician* (grade 3) will be responsible for the purification and assay of DNA binding proteins; experience in microbiology and/or protein purification would be an advantage. Applicants should have at least 3 years relevant experience and minimum qualification of OTEC or equivalent. Applications will also be considered from recent graduates for appointment as graduate Trainees for an initial 12 months.

All three positions are available for up to three years. Salaries will be in the range £9,865-£15,720 p.a. for the postdoctoral positions and £6,636-£7,828 p.a. for the technician. Graduate Trainees will receive an initial £6,395 p.a. (all salary scales under review). Applicants should send a C.V. including names and addresses of two referees to **Professor G. Roberts, Department of Biochemistry, University of Leicester, Leicester LE1 7RH** by [closing date to be inserted four weeks after insertion of advert]. For further information contact Dr. Eva Hyde or Dr. Vasudevan Ramesh (0533 523051) or Professor Gordon Roberts (0533 523054). (9106)A

# ПЕРЕВОДЧИКИ!

## FOR RUSSIAN-ENGLISH SCIENTIFIC AND TECHNICAL TRANSLATIONS

You can follow the latest Soviet research in your field, and supplement your income, by translating in your home on a free-lance basis. If you have good command of English, a good knowledge of Russian, and experience or academic training in a scientific or technical discipline, you may be qualified for our translation program. Immediate openings are available in chemistry, biology, medicine, physics, mathematics, materials science, and biomedical, environmental, and chemical engineering, as well as other fields.

For additional information write or call:

**Translations Editor  
Plenum Publishing Corporation  
233 Spring Street, New York, N.Y. 10013, USA  
Tel: (212) 620-8441**

(NW3233)A

## SERUM AND VACCINE PRODUCTION BIOCHEMISTS AND PROCESS BIOTECHNOLOGISTS

Applications are invited for positions in a newly completed facility in the Serum and Vaccine Production Division of the South African Institute for Medical Research in Johannesburg.

Biochemists to carry out research and development should have an M.Sc. or a B.Sc Hons with a good track record in protein chemistry.

Process Biotechnologists should be registered, but expertise in microbiology and fermentation techniques is the main requirement.

On offer are competitive salaries together with pension, medical aid, housing benefits and relocation assistance.

Applications together with detailed curriculum vitae should be sent to:

**The Deputy Head  
SASTO  
Second Floor  
16 Charles II Street  
London SW1Y 4QU**

to arrive not later than 26th May.

The South African Institute for Medical Research is committed to non discrimination in the selection and promotion of its staff and in its administration. (W6082)A

## UNIVERSITY OF SOUTHAMPTON Department of Clinical Biochemistry

### The Spread of Malignant Tumours in the Human Body Postgraduate Research Assistant Grade 1B

Applications are invited from graduates with good honours degrees to work on a 3 year project funded by the CRC. This is a challenging project concerned with understanding the molecular mechanisms by which cancer cells spread (metastasis) from the primary site and give rise to tumours in distant organs. Experience in molecular biology/cell biology will be an advantage but not essential, as training will be given. Opportunities may exist for the successful candidate to register for a higher degree.

Starting salary up to a maximum of £9,865 on the University Research Staff 1B scale (£8,675 - £13,365), depending on age and experience. The position is available immediately.

Further information may be obtained from: **Dr P A Whittaker, University Department of Clinical Biochemistry, Southampton General Hospital, Tremona Road, Southampton SO9 4XY. (Telephone (0703) 777222 Ext 3856).** To whom applications with a full CV and names of two referees should be submitted by 18th May 1989. (9127)A

## PROFESSOR/ DIRECTOR PETER MacCALLUM RESEARCH LABORATORIES

### PETER MacCALLUM CANCER INSTITUTE AND THE UNIVERSITY OF MELBOURNE

Applications are invited for appointment as Professor/Director of the Peter MacCallum Research Laboratories at the Peter MacCallum Cancer Institute in conjunction with The University of Melbourne.

The appointee will be expected to have a record of outstanding achievement in a field of research related to cancer, and proven ability to manage a major research team.

The salary and conditions of appointment will be in accordance with those for a Director under the appropriate hospital award for scientists or medical graduates. Currently the position carries a salary of \$A82,181 p.a. plus superannuation provisions.

Requests for further information concerning the conditions of appointment should be directed to the Chief Executive Officer, Peter MacCallum Cancer Institute, telephone (613) 641 5795, facsimile (613) 670 3357.

Applications (marked "Confidential") should be forwarded by 30th June, 1989 to:

Chief Executive Officer,

### ROYAL FREE HOSPITAL SCHOOL OF MEDICINE (University of London)

### RESEARCH TECHNICIAN DEPARTMENT OF SURGERY

Applications are invited for the above research post largely based in the development of new harvest techniques for endothelial cells of vascular origin. The project is funded for two years by a grant from NETHRA.

This work will involve extensive studies on isolation and culture of endothelial cells in a project which is anticipated to lead to a major advance of the treatment of patients with vascular disease. There will also be an opportunity to gain experience in the fields of molecular biology and immunology, particularly in relation to production of new monoclonal antibodies for cell isolation. The successful applicant should have an appropriate background in cell studies. There will be an opportunity to register for a higher degree for a suitably qualified candidate.

Salary on scale £8,682-£11,415 including London Allowance. Job description and application form available from the **School Office, Room G650, R.F.H.S.M., Rowland Hill Street, London NW3 2PF.** Tel. (01-794-0500 Ext: 4262). Please quote Ref: RT/GH. Closing Date 12th May, 1989. (9091)A

## Cancer Molecular Biologist

£11,000 + Benefits

A research assistant is required to join our established Cancer Molecular Biology Group. Current projects include the cloning and analysis of receptors which may play a role in chemically-induced carcinogenesis. A variety of techniques are routinely used including cDNA cloning, sequencing, site-directed mutagenesis and mammalian gene transfer.

#### If you have ...

- ★ A scientific background to degree standard or an HNC with experience in molecular biology.
- ★ A strong interest in molecular biology.
- ★ Analytical and creative approach to problem-solving.
- ★ Good organisational skills to plan and perform your own work.

#### We offer ...

- ★ Development within the job through increased responsibility for your own work.
- ★ Opportunity to Co-author any published work.
- ★ A benefits package including profit sharing bonus, share option, contributory pension scheme, health insurance plan and re-location assistance.
- ★ Modern facilities with excellent support for laboratory work.

If you want more information about this creative and demanding opportunity ring 0625 515428.

Please send a full CV, including your current salary and names of two referees by May 17, 1989 to: ICI Central Toxicology Laboratory, Alderley Park, Macclesfield, Cheshire SK10 4TJ.

Ref: MB/N

### ACADEMIA EUROPAEA

The Academia Europaea was created in 1988 and is an independent Academy covering all areas of knowledge and the whole of Europe. It has at present 500 members but is growing quite rapidly and is in the course of developing its activities. From later this year it will operate from headquarters in London.

We are seeking an

### EXECUTIVE SECRETARY

to take charge of all aspects of its administration. The candidate should have had previous administrative experience preferably with a European or international context. It is desirable to have a working knowledge of at least one European language. Less than full time service can be considered. Salary will be generous and subject to negotiation.

Send applications with curriculum vitae and names of two persons who may be consulted as referees to:

**Academia Europaea  
10c St. Edward's Passage,  
Cambridge, CB2 3PJ**

(9046)A

### ST GEORGE'S HOSPITAL MEDICAL SCHOOL (University of London)

### CELLULAR/MOLECULAR BIOLOGIST

Applications are invited from postdoctoral scientists interested in continuing a Wellcome Trust project in the Anatomy Department, on the cellular and molecular biology of mouse germline mutations in melanocyte development. Little preparatory work should be needed. You will join an active multidisciplinary group with interests in cell differentiation and malignancy. Experience in mammalian cell culture, mammalian genetics or molecular genetics is desirable. Salary on 1A scale. Starting date negotiable, from May 22 onwards. Approximately 21-24 months' support remain, depending on salary, with a possibility of extension.

For further details and application form, please contact the **Personnel Officer, St George's Hospital Medical School, Cranmer Terrace, London SW17 0RE** (Tel. 01-672 9944 x56020), quoting reference 53/89. Informal enquiries to Dr D Bennett (x55202). Closing date 25 May 1989. (9093)A

**The Elmer V. McCollum Professor  
and  
Chair  
Department of Biochemistry  
The Johns Hopkins University  
School of Hygiene and Public Health**

Applications and nominations are invited for the position of Chairperson of the Department of Biochemistry at the Johns Hopkins School of Hygiene and Public Health. The general research interests of the current faculty include: Biochemistry — enzyme structure and mechanisms; peptide chemistry; chromatin and nucleic acid chemistry; mechanisms of nucleic acid replication, recombination and repair; structure and function of cell surface molecules; somatic mutation and antibody diversity; cell metabolism; influence of nutrition in carcinogenesis. Biophysics — structure and interaction of biopolymers in cells; synthesis of oligo- and polynucleotides of designed structure and sequence; structure and function of the mammalian genetic apparatus; development of antiviral and chemotherapeutic agents; basic mechanisms of aging. The Department also participates in a University-wide concerted effort in areas of macromolecular assemblies and interactions for which it has received considerable Federal and private support.

Candidates must have an outstanding record of research achievement in any area of biochemistry, biophysics or molecular biology, whether or not the area is currently represented in the Department; and the desire and ability to provide strong leadership to an already excellent, vibrant, growing department in the interdisciplinary setting of the School of Hygiene and Public Health.

Interested persons are encouraged to submit a curriculum vitae to:

**Dr. Barry Zirkin**  
**Chairman of the Biochemistry Search Committee**  
**Division of Reproductive Biology**  
**The Johns Hopkins School of Hygiene and Public Health**  
**615 North Wolfe Street**  
**Baltimore, MD 21205**

The Johns Hopkins University is an Equal Opportunity employer

(NW3650)A

**THE JOHN THOMAS LADUE MCGINTY  
EMINANT SCHOLAR CHAIR  
in Marine Biology  
at Florida Atlantic University,  
a Member of the Florida State University System**

Applications and nominations are invited for the John Thomas Ladue McGinty Eminent Scholar Chair in Marine Biology at Florida Atlantic University. This position is supported by a \$1,000,000 endowment and will be filled at a senior level in the Department of Biological Sciences, College of Science.

Applicants and nominees should have a distinguished academic and research reputation that includes a successful record in obtaining contract and grant support. The primary responsibilities of the successful candidate will be to contribute significantly to the expansion of the teaching and research programs in the Department of Biological Sciences and to provide graduate level training in his or her field of speciality.

Florida Atlantic University is a four-year and graduate state university with an enrollment of over 11,000 students and a plan for growth in numbers of students and in graduate programs over the next five years. The Florida Board of Regents has initiated seven new doctoral programs in Science and Engineering at Florida Atlantic University in recent years. In addition, the University currently has nine Eminent Scholar Chairs, and funding for a tenth has been pledged. The combination of this program development and of the impact of nine Eminent Scholar Chairs has brought about a quality research and teaching environment on campus that will be significantly enhanced by the addition of the John Thomas Ladue McGinty Scholar.

The central campus of Florida Atlantic University is located in Boca Raton, approximately two miles west of the Atlantic Ocean and forty miles north of Miami. The Department of Biological Sciences is housed in a five-storey building devoted primarily to teaching and research in biology. An oceanside marine laboratory will soon be under construction, and is located within a ten-minute drive of the campus. It will feature a flow-through seawater system, wet tables, and culture ponds.

The Eminent Scholar Search Committee represents faculty, students, and the community. The deadline for applications is July 1, 1989. Applications and nominations should be addressed to: **Dr. Walter R. Courtenay, Jr., Chair, Eminent Scholar Search Committee, Department of Biological Sciences, Florida Atlantic University, Boca Raton, Florida 33431-0991.**

An Affirmative Action/Equal Opportunity Institution

# VIROLOGIST

**P**fizer is one of the world's leading research-based pharmaceutical companies. Our Sandwich research facility, where a significant part of our anti-infective drug discovery programme is based, currently employs about 700 scientists and support staff. Our present anti-viral strategies include both classical and molecular genetic-based approaches to viral diseases including AIDS. We are seeking to expand the virology group and require a Post-doctoral Virologist to join our team.

**C**andidates should have:

- A PhD in Virology
- 1-3 years Post-doctoral experience in Virology or Molecular Genetics of viruses

**We** can offer:

- The chance to develop within a dynamic anti-viral team
- A highly competitive salary with merit-related bonuses of up to 20% of salary

- Generous relocation assistance and other benefits including pension, life assurance and private health care schemes
- Flexible working hours and an active sports and social club

**T**his is a particularly exciting time to join Pfizer as we have a multi-million pound expansion of our research facilities under construction, demonstrating our long-term commitment to research and enabling our scientists to look forward with confidence to the 1990's and beyond.

**We** are located within easy reach of both Canterbury and the Continent and there is a wide range of housing with prices amongst the lowest in the south-east.

**I**f this advertisement attracts your interest, please write in confidence, giving full details of career-to-date to Mr D O'Callaghan, Pfizer Central Research, Ramsgate Road, Sandwich, Kent CT13 9NJ. Tel: (0304) 616415.

## YALE UNIVERSITY SCHOOL OF MEDICINE

### Postdoctoral Positions in DEVELOPMENTAL NEUROBIOLOGY

Two positions are available to study molecular and cellular aspects of development in the mammalian visual system.

One position will study the regulation of expression of identified retinal genes in order to understand how known cellular events in retinal development lead to changes in expression of groups of genes (see Mol. Cell. Biol. 8:1570, 1988). Good background in molecular biology is preferred.

The other position will use monoclonal antibodies and biochemical methods to study the differentiation of cell types and the formation of synaptic circuits in visual cortex (see TINS 12:28, 1989). A good background in immunocytochemical methods is preferred.

Send C.V. and names of two referees to: **Dr. Colin J. Barnstaple, Department of Ophthalmology and Visual Science, Yale University School of Medicine, P.O. Box 3333, New Haven, CT 06510.**

(NW3653)A

## UNIVERSITY OF ABERDEEN DEPARTMENT OF ZOOLOGY

### POSTDOCTORAL RESEARCH ASSISTANT

Candidates are invited to apply for the above position, which is available for a three year period, to investigate how certain strains of fish bacterial pathogens avoid killing by salmonid macrophages. Preference will be given to candidates with immunological and tissue culture experience; previous experience with fish cells is not vital. For further details on the project contact Dr C Secombes (tel 0224 272872) or Mrs Reid (tel 0224 272859) in the Department of Zoology. Starting salary up to £10,460 on the IA (postdoctoral) Scale.

Further particulars and application forms from the **Personnel Office, The University, Regent Walk, Aberdeen AB9 1FX** (tel 0224 273500) to whom applications (2 copies) should be returned by 19 May 1989 quoting reference number LW/020. (9074)A

## UNIVERSITY OF LONDON

### Chair of Clinical Veterinary Medicine

at

### The Royal Veterinary College

The Senate invites applications for the established Chair of Clinical Veterinary Medicine at The Royal Veterinary College.

Candidates should have a proven record of excellence and leadership in research and clinical work. The College would be especially pleased to receive applications from those whose interest is in farm animals.

Potential applicants are encouraged to contact the Principal of The Royal Veterinary College, Professor Lance Lanyon, telephone: 01-387 2898, fax: 01-388 2342.

Intending applicants should obtain further particulars from the **Academic Registrar, (N) University of London, Senate House, Malet Street, London WC1E 7HU**, before submitting applications (10 copies).

Closing date for applications: 15 June 1989 (9129)A

## Ph.D.'s

Biotech Research Labs in Rockville, has openings for 2 Ph.D.'s.

**HIV RESEARCH:** Individual will be responsible for HIV research. We are looking for an individual who enjoys a challenge to help solve the mysteries of HIV.

**MOLECULAR BIOLOGIST:** Individual must have experience with recombinant DNA techniques. Familiarity with characterization of genomic DNA in construction of expression vectors is preferred.

We offer competitive salaries and an excellent benefits package. If interested, please submit a CV to:

### BIOTECH RESEARCH LABS

1600 East Gude Drive, Rockville, Maryland 20850. Attn: Personnel  
EOE M/F/H/V (NW3646)A

**INSTITUTE OF HYDROLOGY  
WALLINGFORD, OXON**

## **HYDROGEOLOGIST**

We are seeking an experienced, innovative, numerate hydrogeologist to join the Consulting Services Section of the Institute of Hydrology. This is a multi-disciplinary team which provides a hydrological and hydrogeological advisory service to overseas governments and British consultants.

The work is directed primarily towards water resources studies in developing countries and, although based at Wallingford, the successful candidate will be expected to travel overseas, mainly on short-term assignments. The hydrogeologist would also be concerned with ground-water pollution and environmental impact studies, often for shallow alluvial aquifers in the UK.

The successful candidate must be highly motivated and must be prepared on occasions to work with minimal supervision or support. Applicants must be skilled in modern mathematical and statistical techniques and must be competent with both micro and mainframe computers. An ability to programme in FORTRAN is essential as support to ongoing software development would form one part of the job. Ideally applicants would have a relevant postgraduate qualification.

The appointment is for three years. Salary will be in the range of £10,026 per annum to £13,460 per annum, or £12,445 per annum to £17,032 per annum depending on age, qualifications and experience. At the higher salary level overseas experience or project management experience would be expected.

Generous holidays and non-contributory pension scheme.

The Institute of Hydrology is a component body of the Natural Environment Research Council.

NERC is an Equal Opportunities Employer.

Further information and application forms may be obtained from **Mrs S Fenton, Institute of Hydrology, Wallingford, Oxon OX10 8BB. Telephone 0491-38800.**

Closing date for applications is 18 May 1989.

**UNIVERSITY OF ALBERTA, DEPARTMENT OF GENETICS**

## **ASSISTANT PROFESSOR**

Applications are invited for a tenure-track position in the Department of Genetics. We are seeking a yeast molecular geneticist, although excellent candidates in other areas of genetics will be considered seriously. Candidates should have a Ph.D. and relevant post-doctoral research experience. The appointee will establish a vigorous independent research program and teach basic genetics as well as advanced molecular genetics. The appointment would commence September 1, 1989 or January 1, 1990 or thereafter. Salary will be commensurate with experience; the Assistant Professor range is currently \$33,144 - \$47,280.

Candidates should send a curriculum vitae, reprints of several research publications, a one-page statement of future research interests, and the names and addresses of three academic referees to:

**Dr. Frank E. Nargang; Chairman, Search Committee; Department of Genetics; University of Alberta; Edmonton, Alberta, T6G 2E9; Canada.**

The closing date for applications is June 30, 1989.

In accordance with Canadian Immigration requirements, this advertisement is directed to Canadian citizens and permanent residents of Canada. The University of Alberta is committed to the principle of equality in employment. (NW3658)A

UNIVERSITY OF

# **essex**

Department of Biology

## **Effluent Treatment by Anaerobic Digestion**

A Research Officer is required to carry out laboratory investigations of a novel anaerobic treatment process for organic effluents, including land fill leachate. Applicants should have some microbiological expertise, and experience with anaerobes would be advantageous. The Research Officer will preferably be at postdoctoral level on Grade IA (£9,865-£15,720 per annum), but well qualified postgraduates will also be considered for appointment on Grade IB (£8,675-£11,680 per annum). The appointment is for 2 years in the first instance, with the possibility of extension for a further year. Informal enquiries may be made to Dr D.B. Nedwell (0206 872211).

**Applications (three copies), including a curriculum vitae and the names and addresses of two referees, should reach the Registrar (R/874/N), University of Essex, Wivenhoe Park, Colchester, CO4 3SQ by 12th May 1989. Further particulars of this post may be obtained by telephoning Colchester (0206) 872462 (24 hours).**

(9102)A

**UNIVERSITY OF LEICESTER**

**X-ray Astronomy Group, Department of Physics**

## **Support Astronomer — ROSAT Guest Observer Programme**

Applications are invited for a UGC-funded, post-doctoral position in support of the UK ROSAT Guest Observer Programme. The ROSAT project is an international collaboration between W. Germany, the UK and the USA. The satellite, due for launch in February 1990, will carry out the first imaging all-sky survey in the XUV and soft X-ray bands. Subsequent pointed observations of individual targets will be made through guest observer programmes in each country. The Guest Observer Support Astronomer will play a leading role in running the UK Guest Observer Centre, which is to be based at the University of Leicester. He/she will have overall responsibility for assisting visiting guest observers with the analysis of their ROSAT observations. The Centre will provide dedicated computing facilities for Guest Observers based on VAX workstations clustered with the Leicester Starlink node computers.

We are looking for a post-doctoral scientist with a background in observational astronomy and experience of data analysis systems who is also keen to develop an astrophysics research programme based on ROSAT. There may also be an opportunity to contribute to the ROSAT data analysis software. The appointment will be for three years, starting in September 1989 or soon after. The salary will be on the R & A IA scale, range £9,865-£15,720 (under review) depending on age and experience.

Applications (together with a curriculum vitae and the names of two referees) should be sent to **Professor K.A. Pounds, Department of Physics and Astronomy, University of Leicester, Leicester LE1 7RH, by 18 May 1989.** (9111)A

**ROYAL FREE HOSPITAL SCHOOL OF MEDICINE**  
(University of London)

Department of Neurological Science

## **POST-DOCTORAL RESEARCH FELLOW/BIOCHEMIST MITOCHONDRIAL DISEASES**

Applications are invited from post-doctoral biochemists to work on the development and tissue specificity of the mitochondrial respiratory chain proteins and their relationship to human mitochondrial diseases. Experience in protein purification immunochemical techniques and enzyme assays would be an advantage. This project, funded for three years by Action Research, will involve collaboration with the Department of Biochemistry, St Bartholomew's Hospital Medical College and the Institute of Neurology, London.

Salary on Range 1A: £9,865-£15,720 p.a. plus £1,650 London Allowance, according to age and experience.

Informal enquiries to Dr Mark Cooper. Tel: (01) 253-9237. Full job description available from the **School Office, R.F.H.S.M., Rowland Hill Street, London, NW3 2PF.** (Tel: 01-794-0500 Ext: 4262), to which applications (two copies of curriculum vitae with names and addresses of two referees) should be sent by **12 May 1989.** Please quote Ref: **RF/NS.** (9090)A

UNIVERSITY COLLEGE LONDON

## Departments of Pharmacology and Clinical Pharmacology

These Departments have a number of Research Council Studentships to offer, for work in the following areas:

- 1) Synaptic, receptor and ion channel pharmacology (D.A. Brown, D. Colquhoun, FRS, D.H. Jenkinson and D.G. Haylett).
- 2) Cell biology (cell to cell communication) in the context of toxicology (A.E. McLean).
- 3) Immunopharmacology: role of mediators and second messengers (M.M. Dale, J.C. Foreman).

Applicants should hold, or expect to obtain, an upper second or better in a relevant biological science, and should be able to comply with the residence requirements of the MRC and SERC.

Please write in the first instance to the **Departmental Postgraduate Tutor (Professor D.H. Jenkinson, Department of Pharmacology, University College London, Gower Street, London, WC1E 6BT)** enclosing a full C.V. giving an indication of your interests, and the names of two academic referees. (9101)A

(a constituent College of Imperial College of Science, Technology and Medicine)  
(University of London)

Norfolk Place, London W2 1PG

## LECTURER IN ANATOMY

Applications are invited for a Lectureship (available from October 1989) in the Department of Anatomy and Cell Biology (within the Division of Basic Medical Sciences). Candidates should have a record of active research in the biomedical sciences and must be able to make a major contribution to one or more of the Department's main teaching areas (Human Anatomy, Cell Biology and Histology, Developmental Biology and Neuroanatomy).

The Department's current research includes grant-funded projects on CNS Responses to Injury, Alzheimer's Disease, Cell Interactions in Peripheral Nerves, Mechanisms of Cell Movement, and Transport and Permeability in Epithelia and Endothelia. Facilities are particularly good for light and electron histochemical methods and for quantitative microscopy. A research interest in the central nervous system is preferred, but candidates able to contribute to existing strengths or to develop new ones will be considered on merit.

Prospective applicants are invited to 'phone the Head of Department, Professor Tony Firth ((01) 723-1252 Ext 5343).

Applications (6 copies) in form of full C.V. with names and addresses of 2 referees should be sent to Personnel Department at above address by 2 June 1989, from where further written details should first be obtained. (9094)A

## UNIVERSITY OF OXFORD

### SIR WILLIAM DUNN SCHOOL OF PATHOLOGY Research Assistant 1A

Salary £9865-£15,720 (under review)

A post-doctoral position is available for three years for research on the role of the nucleoskeleton in transcription and replication. (See J. Cell Sci. 90, 1-6, 1988 for a review). The position is funded by the Cancer Research Campaign from April 1989, but could start later by arrangement. Further details may be obtained from Dr. Peter Cook (Tel: 0865-275528).

Applications in writing, together with c.v. and names and addresses of two referees should be sent to **The Administrator, Sir William Dunn School of Pathology, South Parks Road, Oxford OX1 3RE.**

Closing date for applications 19 May 1989.

(9112)A

*The University is an Equal Opportunity Employer*

## School of Biology and Biochemistry and The Institute for Animal Health, Pirbright

## RESEARCH ASSISTANT IN MOLECULAR VIROLOGY

The above post is supported under the LINK Project Scheme (QUB-AFRC) for two years to work on the construction of chimeric bovine enterovirus (BEV) and Foot and Mouth Disease strains for future vaccine development. The successful applicant will work principally at the Institute of Animal Health and be in close collaboration with staff in Queen's where vector development work is currently underway.

Applicants must have or expect to obtain an Honours degree in a biological science related subject and preferably have some experience in molecular biology.

Commencing salary in the range £8,676-£9,867 (under review) with eligibility for USS.

Informal enquiries may be directed to Professor S. J. Martin (Belfast (0232) 329241, ext 2491) or Dr. A. M. King (Pirbright (0483) 232441).

Applicants, quoting ref. 89/AA, should submit a curriculum vitae, including the names and addresses of two referees to the Personnel Officer, The Queen's University of Belfast, Northern Ireland, BT7 1NN.

Closing date: 30 May 1989.

The University is an Equal Opportunity employer. (9123)A

The Queen's University of Belfast.

## ROYAL FREE HOSPITAL SCHOOL OF MEDICINE (University of London)

DEPARTMENT OF VIROLOGY

### TWO POSTDOCTORAL SCIENTISTS ONE RESEARCH ASSISTANT

required to join expanding team investigating cytomegalovirus infections. Each post is for 3 years.

**POSTDOCTORAL POSITION ONE (ref. PD/RF)** will modulate the cell surface expression of Class I HLA molecules to determine if CMV can use these proteins as cellular receptors. Experience of recombinant DNA or immunological techniques desirable.

**POSTDOCTORAL POSITION TWO (ref. JG/RF)** will study the interaction between CMV and  $\beta_2$ -microglobulin to characterise, sequence, clone and express the viral proteins involved. Experience of the purification of proteins (not necessarily viral) from a complex mixture would be an asset.

**RESEARCH ASSISTANT (ref. SB/RA)** will participate in the studies of CMV,  $\beta_2$ -microglobulin and Class I interactions. Immunological experience desirable. Salary will be paid on Research Scales 1A/1B as appropriate plus £1,650 London Allowance. The Department is situated in modern purpose-built accommodation and is well equipped. These projects will provide ideal opportunities to broaden experience of modern virological techniques. Informal visits are welcome (tel. 01-794 0500 x3210 (Dr. Griffiths), x4118 (Dr. Grundy) or x4201 (Dr. Baldwin)).

Further particulars can be obtained from the **SCHOOL OFFICE (x4262), R.F.H.S.M., Rowland Hill Street, London NW3 2PF**, to which applications (FOUR copies of curriculum vitae including the names and addresses of two referees) should be sent by 12 May. (9099)A

# SCIENCE IN EUROPE

## University of Amsterdam

The Faculty of Biology has a vacancy for an

### assistant professor (m/f)\* N.6768.

in the molecular biology of lower plants  
Full-time

The position is within the department of molecular cell biology.

Applications are invited for a five-year appointment to augment molecular biological approaches in the program "Sexual development in the green alga *Chlamydomonas*", in the Section Plant Physiology.

Requirements and qualifications:

- satisfactory didactic qualities for participating in advanced undergraduate and graduate courses
- postdoctoral experience in any area of plant molecular biology
- considerable organizing ability
- supervising PhD and MSc students and initiate novel approaches in the above mentioned program.

\* Women in particular are invited to apply.

The successful applicant will be expected to learn the Dutch language within two years.

The gross salary depends on experience and ranges from Dfl. 6.957,- to Dfl. 9.957,- per month (Dutch Civil Servants Code).

Further information can be obtained by telephoning or writing to the secretary of the nomination committee, Prof. H. van den Ende, Department of Molecular Cell Biology, University of Amsterdam, Kruislaan 318, 1098 SM Amsterdam, The Netherlands (telephone 031 - 20 525 7847) to whom applications with a curriculum vitae - within 3 weeks - should also be sent. A statement of research interests and the names of two referees should be forwarded.

## PROFESSOR OF ASTROPHYSICS WITH COSMOLOGY\*) AT STOCKHOLM OBSERVATORY

The University of Stockholm hereby announces a position as professor of astrophysics with cosmology at Stockholm Observatory open for application. The successful candidate will be expected to be actively engaged in research, to participate in teaching (in Swedish or English) including supervision of graduate students, and to take part in local, national, and international administration duties of the Observatory.

\*)The area of responsibility for the position covers the whole of astrophysics including cosmology. The candidate is required to have a scientific background within *either one* of these areas. The specialization can be observational or theoretical.

Application: The application should be made to "The Swedish Government" and the mailing address is:

**Rektorsämbetet  
Stockholm University  
S-106 91 STOCKHOLM  
Sweden**

The application should be accompanied by:

1. Detailed curriculum vitae and bibliography
2. Short written account of scientific work and teaching experience
3. Copies of records or documents that the applicant wishes to submit to verify his qualifications
4. Four reprints or preprints of each of the applicant's scientific publications numbered according to the publication list

Closing date: The formal application and documents under item 1 above must be received by the University not later than **May 8, 1989**. (It is advisable to submit the formal application by telex to 8105199 UNIVERS or telefax (0)8-159522.)

Documents under items 2-4 above must be received by the University not later than **May 29, 1989**. (W6092)A

## Ausschreibungstext zur Planstelle eines/einer Ordentlichen Universitätsprofessors/Universitätsprofessorin für Pharmazeutische Chemie (Nachfolge Univ.-Prof. Dr. Wilhelm KLÖTZER)

Am Institut für Organische und Pharmazeutische Chemie der Naturwissenschaftlichen Fakultät der Universität Innsbruck ist die Planstelle eines/einer

## Ordentlichen Universitätsprofessors/Universitätsprofessorin für Pharmazeutische Chemie (Nachfolge Univ.-Prof. Dr. W. KLÖTZER)

zu besetzen. Der/die Stelleninhaber/in hat das Fach Pharmazeutische Chemie in Forschung und Lehre zu vertreten. In diesem Fach sollte er/sie sowohl in der Forschung entsprechend ausgewiesen sein als auch Erfahrung in der Lehre nachweisen können.

Bewerber/innen mit einschlägiger Habilitation oder gleichwertiger Qualifikation werden gebeten, ihre Unterlagen (Lebenslauf, Schriftenverzeichnis, Sonderdrucke der fünf wichtigsten Publikationen, Angaben über Erfahrung in der Lehre) bis **31. Juli 1989** beim Dekan der Naturwissenschaftlichen Fakultät der Universität Innsbruck, A-6020 Innsbruck, Innrain 52, einzureichen.

Die Universität Innsbruck strebt eine Erhöhung des Anteils von Frauen am wissenschaftlichen Personal an und fordert deshalb qualifizierte Frauen nachdrücklich auf, sich zu bewerben.

(W6096)A

## THE COMMISSION OF THE EUROPEAN COMMUNITIES

is carrying out a selection procedure with a view to drawing up a reserve list from which to appoint staff in grade A3 for implementing the

### FUSION PROGRAMME

(COM / R / A / 37) HEAD OF UNIT / ADVISER (grade A3)

**Duties:** under the authority of the Director of the Fusion Programme, either:

☐ heading the unit responsible for coordinating Community research on the physics of fusion and for scientific and technical management of the Fusion Associations; ☐ or coordinating the work involved in drawing up the Community's Fusion Programme and acting as its representative to other Community institutions (European Parliament, Council) and outside bodies.

**Qualifications:** University education with degree or diploma in a relevant discipline.

**Experience:** at least 15 years' work in controlled thermonuclear fusion or an associated field.

#### GENERAL CONDITIONS

**Contracts:** only temporary contracts of fixed or indefinite duration are offered to research staff. **Nationality:** candidates must be a national of one of the Community Member States. **Place of employment:** Commission staff must be available to work in any of the Commission's places of activity and in many cases outside their country of origin. **Age:** candidates must have been born after 1 June 1933. **Knowledge of languages:** candidates must have a thorough knowledge of one Community language (Danish, Dutch, English, French, German, Greek, Italian, Portuguese or Spanish) and a satisfactory knowledge of a second Community language.

**Closing date:** requests for application forms must be made in writing not later than 15.5.89 (postmark) to the following address: C.E.C., Secretariat for Selection Committees Research, SDME R2 / 82, rue Montoyer 75, B-1040 Brussels (tel.: 02 / 235.56.60).

These application forms, duly completed and signed, must reach the above address not later than 6.6.1989.

**Eligibility:** candidates must ensure that: ☐ the above deadlines are met; ☐ their application form is legible, complete and signed; ☐ copies of certificates and other documents specified in the application form are attached; ☐ the other conditions set out above are satisfied, failing which they will be disqualified.

The Commission is an equal opportunities employer.

(W6071)A

### UNITE DE NEUROBIOLOGIE INSERM U6 MARSEILLE POSTDOCTORAL RESEARCH FELLOW IN NEUROBIOLOGY

A postdoctoral fellow is required to join a multidisciplinary team concerned with the information processing by the dendrites of mammalian neurones studied in vivo, in brain slices and in culture. The successful applicant will participate in studies on characterisation of receptor-channels with particular emphasis on patch-clamp and optical recording methods. Preference will be given to individuals with a strong research record in biophysical approach to study membrane excitability and with experience in cell culture.

The position is tenable for a period of one year with possible renewal for a second year. The starting date is not later than September 1989. Send curriculum-vitae, a statement of research interests and three letters of reference to:

Dr. S. TYC-DUMONT,  
Unité de Neurobiologie, INSERM U6,  
280 Bd Sainte-Marguerite,  
13009 Marseille, France  
(Tel. 91 75 02 00).

(W6090)A

### University of Göttingen, Germany Biochemist, Ph.D.

A postdoctoral position is available immediately for two years with payment according to BAT. Experience with DNA and micro-computers is essential, knowledge of immunology and publication procedures desirable. The appointed person will join a young group dealing with various aspects of genetic diseases and is expected to develop new techniques in this area. Candidates from the U.K. are especially encouraged to apply. Informative documents to Dr. J. Reiss, Institute of Human Genetics, Gosslerstrasse 12d, D-3400 Göttingen.

(W6107)A

The European Molecular Biology Laboratory, an international research organization situated in Heidelberg, West Germany, has the following vacancy:

### TECHNICAL ASSISTANT

The successful candidate will work in a group concerned with the problems of membrane protein traffic in animal cells. The techniques employed include cell fractionation, in-vitro protein synthesis, DNA/RNA isolation and characterization, site directed mutagenesis. Knowledge of nucleic acid methodology would be advantageous.

Appropriate training and experience in biochemical and molecular biology is essential. Preference will be given to candidates having experience in the application of cell and molecular biological techniques. (DNA manipulations, transfection protein isolation and characterization). A working knowledge of English is essential; a second language (French or German) is desirable.

We offer an above-average salary, plus certain allowances depending on personal circumstances.

Please write briefly for an application form, quoting reference no 88/42, to:

EMBL, Personnel Section,  
Postfach 10.2209, D-6900  
Heidelberg, Federal  
Republic of Germany.

EMBL

(W6093)A

# HOLphar

subsidiary of Fournier Laboratories, a leading pharmaceutical company with a strong commitment to cardiovascular research, is currently seeking two Peptide Chemists for its up-to-date facility in Saarland, West-Germany.

The company offers the opportunity to participate in the creation of a research unit for the study of membrane proteins and lipid-peptide interactions with the aim of designing therapeutic agents effective in the treatment of cardiovascular disease.

Successful candidates will develop new peptide synthesis and peptide modification protocols.

Applicants should have a PhD (or equivalent) as well as in depth knowledge of tBOC and Fmoc chemistries, cleavage chemistries and purification methods. Experience in computer science and peptide modeling is an advantage. Ideal candidates have well developed practical skills and an innovative and enthusiastic approach to work. Knowledge of German is a plus.

All written applications should outline qualifications: educational background and working experience. Send résumé together with three letters of reference to the **Director, Department of Human Resources, HOLphar Arzneimittel GmbH, Justus-von-Liebig-Str. 16, 6603 Sulzbach, West-Germany.**

(W6104)A

## EMBL

The European Molecular Biology Laboratory, an international research organization situated in Heidelberg, West Germany has the following vacancies at its outstation in Grenoble:

### Structural Molecular Biologist

The Grenoble Outstation of the EMBL is a structural molecular biology laboratory which aims to combine expertise in biophysical techniques (notably neutron and X-ray methods) with modern methods of molecular biology. The laboratory is situated at the Institut Laue-Langevin, a high flux neutron source and adjacent to the future European Synchrotron Radiation Facility and is well equipped for neutron scattering, X-ray crystallography (including access to a FAST detector), electron microscopy, dynamic light scattering and molecular biology. Current interests include the molecular biology and X-ray crystallography of surface viral glycoproteins (adenoviruses and myxoviruses) and amino acyl-tRNA synthetases, the dynamics of proteins studied by inelastic neutron scattering, the structure and dynamics of supercoiled DNA and in-vivo deuteration. There are vacancies for up to three staff scientists to contribute to existing projects or to initiate new projects suited to the scientific environment of the laboratory.

Candidates in the following areas will be considered (the examples are not to be considered exhaustive):

- Neutron scattering in biology (e.g. high resolution neutron crystallography of deuterated proteins, or low resolution crystallography of macromolecular complexes).
- X-ray protein crystallography (including new techniques such as diffuse scattering or Laue diffraction).
- Molecular biologist/biochemist with an interest in structural problems (e.g. protein/nucleic-acid interactions, virus/cell interactions).

Staff scientists will be appointed on an initial contract of three to five years on grades 8 or 9 depending on age and experience. An above-average tax-free salary is offered. Certain allowances are payable in addition, depending on personal circumstances.

Further information and application forms can be obtained by writing (with enclosed CV and brief statement of interests) to the **Director quoting reference no. 89/22: EMBL Grenoble Outstation, c/o ILL, 156X, 38042 Grenoble Cedex, France.** (W6077)A

### INSTITUTE OF BIOTECHNOLOGY, UNIVERSITY OF HELSINKI RESEARCH DIRECTORS

The Institute of Biotechnology, University of Helsinki, is a new inter-faculty research unit with a special Ph.D. training program. At present, about 50 persons are working at the Institute, which has an annual budget of about USD 2.5 million.

The Institute will focus on basic research in different fields of molecular biology essential for the development of modern biotechnology. The research will be carried out in programs led by the Director of the Institute and Research Directors, who have the title of Professor.

The Institute has modern facilities for molecular and cell biology. It has and will have funds available for special equipment needed in new research programs, such as X-ray crystallography.

Applications are invited for research directors in the general field of molecular biology, preferably from those with training in:

- **Plant Molecular Biology**
- **Microbiology**
- **Biological Structures (Crystallography, Electron Microscopy)**
- **Developmental Genetics**

The research directors are appointed for a 5-year period (renewable) but can be made permanent for special reasons. The applicants should hold a Ph.D. or an equivalent degree, a substantial publication record and experience in directing scientific research. The salary is at the level of university professor in Finland (FIM 175,000-225,000; equivalent to USD 41,000-52,000).

Applications should be addressed to the **Board of the Institute of Biotechnology, Registrars Office of the University of Helsinki, Hallituskatu 8, SF-00100 Helsinki, Finland.** The applications should be at the University of Helsinki not later than May 31st, 1989.

Applications should include:

- 1) **curriculum vitae**
- 2) **list of publications 1980-1989**
- 3) **reprints of publications 1985-1989**
- 4) **a 5-year research plan**, with an estimation of the personnel required and possible plans for financing
- 5) **date when the applicant is available**

The Research Directors will be appointed by the Chancellor of the University after consultation with the Scientific Advisory Board of the Institute. The positions will be filled during the autumn of 1989.

For further information please contact Prof. Lauri Saxen (Chairman of the Board; telephone +358 0 4346433) or Prof. Helge Gyllenberg (Acting Director; telephone +358 0 4346041 or telefax +358 0 4346028). (W6031)A

# UNIVERSITY OF LEIDEN

Faculty of Mathematics and Sciences, Department of Biology

## professor of ethology (f/m) (full time)

vacancy number: 9-099/2407

The appointee will work within the research group Ethology in the Organismal Zoology. The central research-theme is the causal relations between animal behaviour and both biotic and abiotic environmental factors as well as the role of learning processes in it. Modification of the current research programme is possible in view of the specific expertise and experience of appointee.

### Function and requirements:

- The appointee will organize and develop the teaching and research of Ethology which requires a wide-ranging and up-to-date survey of the field.  
The research-programme will require a quantitative and experimental approach to functional and causal problems;
- in view of the desired collaboration with other research-projects within the department of Biology a strong interest in evolutionary problems is of importance;
- the appointee will likewise become involved in the organization teaching and research.

Further information can be obtained from:  
Prof. dr. J.L. Dubbeldam, tel. 071-275039 and  
from Mrs. dr. L.G. van der Molen, secretary tel.  
071-274982/275174.

Applicants, and also those who wish to suggest potential candidates, are requested to contact the chairman of the Selection Committee:  
Prof. dr. J.L. Dubbeldam, Department of Biology, Kaiserstraat 63,  
P.O. Box 9516, 2300 RA LEIDEN.

Applicants, with the number of the vacancy on the letter and the envelop, should submit within two months a full CV (including the names of three referees?), a list of publications and a description of current research interests to the address above.

(W6073)A

## British-German Academic Research Collaboration Programme ARC

The British Council in Germany invites applications for support under this new programme to promote collaboration between research groups in higher education institutions in Britain and the Federal Republic of Germany.

Priority will be given to research projects in science, engineering and business related studies. Applications in the social sciences will also be considered.

Financial support, contributing towards travel and living costs, will be given either for initial exploratory visits or in support of agreed projects between research groups in the two countries.

ARC is financed jointly by the British Council and the German Academic Exchange Service (DAAD) with additional support from the Anglo-German Foundation for the Study of Industrial Society.

For more information and application forms, British research groups should apply to: The British Council, Science Officer, Hahnenstr. 6, 5000 Cologne 1, West Germany. Tel: 0221-20644-33 Fax: 0221-20644-55. Telecom Gold: 81:BC0024.

The  
British  
Council

FOUNDATION FOR RESEARCH AND TECHNOLOGY HELLAS (F.O.R.T.H.)

INSTITUTE OF MOLECULAR BIOLOGY & BIOTECHNOLOGY

# POSTDOCTORAL PROGRAMME

The IMBB, founded in 1983, is an independent research and training institution, international in orientation. It is part of the Foundation for Research and Technology — Hellas/ Research Center of Crete, and is funded by the Greek Government, the Mediterranean Integrated Programme of the European Economic Community, and competitive grants. Some information about it can be found in a recent article in *Science* (243: 470-471, 27 Jan. 1989). Its current departments, group leaders and activities are as follows:

**INSECT MOLECULAR GENETICS (F. C. Kafatos, C. Louis, A. Robinson, C. Savakis):** Gene regulation in *Drosophila*; A complete physical map of *Drosophila*; Genetics, molecular biology and engineering of an agricultural pest, the Mediterranean fruitfly.

**MAMMALIAN MOLECULAR GENETICS (N. Anagnou, N. Moschonas, J. Papamatheakis, V. Zannis):** Gene regulation in the MHC locus; human gene regulation and disease (apolipoprotein genes; globin genes/thalassaemias; glutamate dehydrogenase genes/neurodegeneration).

**YEAST MOLECULAR GENETICS (D. Alexandraki, G. Thireos):** Transcriptional and translational control; general control of amino acid metabolism; sequencing and functional analysis of the yeast genome.

**PROTEIN STRUCTURE AND FUNCTION (M. Kokkinidis, K. Petratos, E. Stratakis):** Protein crystallography and modelling; development of structure prediction techniques; enzyme engineering; variants of a biological pesticide (*Bacillus thuringiensis*).

**PLANT AND PLANT PATHOGEN MOLECULAR GENETICS (N. Panopoulos, M. Tabler, M. Tsagris):** Phytopathogenicity genes; plant viruses and viroids; genetic engineering for plant protection and its safety assessment.

**ENZYME TECHNOLOGY (V. Bouriotis):** Methods for protein purification; downstream processing; enzymes for molecular biology.

**IMMUNOLOGY AND DIAGNOSTICS (E. Krambovitis):** Hormone immunodiagnostics; molecular diagnostics and immunodiagnostics for human, animal and plant diseases.

**ELECTRON MICROSCOPY (V. Galanopoulos):** Structure function and differentiation of cytoskeletal elements in developing insect follicles.

The IMBB invites applications for postdoctoral research and training in all of the above groups. Fellowship support is available, but eligible applicants are encouraged to apply for international fellowships (EMBO, EEC, etc), with IMBB support guaranteed as a backup.

Please contact the pertinent group leader(s).

C/o Georgia Houlaki, Administrative Secretary

# Scientific Computing and Automation (EUROPE)

Conference and Exhibition, 12-15 June 1990, Maastricht, The Netherlands

The 2nd **SCA** conference and exhibition will be held in Maastricht, The Netherlands, an ideal location which takes the meeting into the heart of Europe.

As before, **SCA** is entirely devoted to computing and automation subjects which cross all scientific disciplines; hence the continued theme 'Les Sciences sans Frontières'.

By definition, a conference which must appeal to a multidisciplinary audience will be broad in scope. Under the Chairmanship of Dr. Erkki Karjalainen from Helsinki, **SCA** will bring together specialists from a wide range of disciplines who will devote their attention to contemporary topics likely to be of particular interest to an audience keen to learn from, and exchange views on, a wide range of issues.

**INTERNATIONAL EXHIBITION:** An international exhibition will complement the SCA conference - both of which will be held under one roof. The exhibition will be organised by the publishers of *Nature* magazine.

The topics for **SCA (EUROPE) 1990** will include:

- Chemical applications for supercomputers
- Sampling strategies and experimental design
- Online databases in chemistry
- Databases for spectroscopy
- Dynamic models for catalysis, processes and metabolism
- Expert systems and statistical tools for the interpretation of laboratory data
- Robotic and discrete automation in the laboratory
- Interfacing tools; software and hardware tools
- Chemical monitoring - multivariate sensors and biosensors
- LIMS and LAN strategies for the laboratory
- Workstations for scientists - RISC, parallel and traditional
- Scientific applications for neural networks and fractals
- Software toolkits for exploratory data analysis and mathematics
- Computer graphics and image analysis
- Designing molecules by computer

For further information, contact:

**SCA (Europe), Reunion International**

## GLAXO INSTITUTE FOR MOLECULAR BIOLOGY S.A.

The Geneva molecular biology research unit of one of the largest pharmaceutical companies in the world has a vacancy for

### POSTDOCTORAL FELLOWSHIPS

The Glaxo Institute for Molecular Biology (GIMB) has a staff of approximately 130. Projects include viral therapeutics, neurobiochemistry and the regulation of cell proliferation and differentiation. We are part of the Glaxo group, Britain's largest pharmaceutical organization, which has an outstanding reputation for the quality of its research and products. GIMB is a leading group in applying genetic engineering to medical research.

Applications are invited for Research Fellowships in the following project areas:

- regulation of IgE synthesis
- molecular neurobiology
- cytokine signal transduction
- fungal molecular biology

Candidates should have appropriate experience in molecular or cell biology.

We offer excellent facilities and research opportunities together with an attractive salary and benefits package. Interdisciplinary and collaborative research is actively encouraged at GIMB.

If you are interested in this position, please send your curriculum vitae with a list of publications and the names of three references to: Rita Gloor, Personnel Manager, GLAXO IMB S.A., 46, route des Acacias, 1211 Geneva 24, Switzerland.

## NEW DATES

## NEW VENUE

# INTERNATIONAL TNO MEETING ON ANIMAL MODELS IN AIDS

Maastricht, the Netherlands

23-26 October 1989

The emphasis of the Meeting will be on the validation of models for human HIV infections, comparison of the different models, pathology and immunology, pathogenesis, antiviral agents and vaccine development. In conjunction with the Meeting an exhibition will be organised.

### Organizing Committee:

M. Horzinek, chairman

G. Galasso, J. Goudsmit, G. Hunsmann, H. Lutz, W.J.C. Melgert, L. Montagnier, N. Pedersen, H. Schellekens

The sessions will be devoted to: HIV-1 and HIV-2 in animal models; Mouse models; Simian retroviruses; Feline retroviruses; Large animal models. The Meeting will start with a general session on AIDS and will be concluded by a round up session. Each session will be introduced by one or more introductory lectures. There is ample opportunity to present free papers and posters. The introductory lectures include E. de Clercq, R. Desrosiers, J. Eichberg, M. Gardner, M. Gonda, J. Goudsmit, O. Jarret, P. Marx, J. McGowan, L. Montagnier, R. Montelaro, O. Narayan, N. Pedersen.

# RHONE-POULENC SANTE

The health division of France's principal chemical group

Invites applications from experienced molecular biologists for three RESEARCH SCIENTIST posts in its newly built Biotechnology Institute near Paris.

## Streptomyces molecular genetics

This position requires a Ph.D. in bacterial molecular biology as well as a minimum of 3-4 years' post-doctoral experience in the Streptomyces field. Familiarity with recombinant DNA technology in Streptomyces microorganisms, as well as experience in cloning genes involved in secondary metabolism, is essential. Réf. 50425/A.

## Mammalian cloning technology

Qualified candidates for this position will have a Ph.D. and good post-doctoral experience in the cloning and analysis of mammalian cDNAs or genes. A proven record of achievement using up-to-date DNA cloning strategies (construction of cDNA libraries in various vectors: screening by oligonucleotide hybridization, immunodetection or expression, subtractive hybridization...) is essential. Réf. 50425/B.

## Transgenic animals

This position requires a Ph.D. level in cellular and molecular biology and a good post-doctoral experience in the production and use of transgenic animals. The candidate should be able to develop a small unit for the production and genetic analysis of transgenic animals. Réf. 50425/C.

Please send your full resume quoting the reference to Media-System, 6/8 impasse des Deux Cousins, 75849 Paris Cedex 17, France.

(W6053)A

## Universität Witten/Herdecke

Postdoctoral Position  
in Biochemistry/  
Molecular Biology

to join project on site-directed mutagenesis of proteins and participate in teaching. Experience in recombinant DNA techniques essential. Send application (with 2 references) before May 20 to:

Prof. Dr. W. Wintermeyer

## EUROPEAN TECHNOLOGY INFORMATION RESEARCH

Asahi Chemical Industry Co. Ltd. is a major Japanese chemical company. It's products cover synthetic fibres, industrial chemicals and petrochemicals, plastics and rubber, food products, pharmaceuticals and medical equipment, electronics, construction materials and housing.

Research and Development, Europe, is responsible for supporting Asahi Research and Development in Japan by providing European new technology and market information.

The Director of R & D, Europe now requires a young science graduate (early to mid-20's) who is interested in all aspects of science, to work as his Assistant in our small, friendly, central-London offices.

The post involves monitoring new European technology, that would be of interest to Asahi, in various fields including biotechnology, electronics and new materials.

The work includes information research, attendance at meetings and conferences and preparation and submission of reports and new technology proposals. Support for current company research would also be required.

Candidates should have a degree in a scientific discipline with 2-3 years experience of information work. Candidates would also be expected to have a high degree of initiative and the ability to work alone as the European Director is frequently away on business.

Computer literacy, together with knowledge of one or more European languages, would be an advantage. Interest in Japan and Japanese business would also be useful.

Salary is commensurate with age and experience. Financial support in learning Japanese would also be considered.

If you are interested in the above position, please send a full CV stating current salary to:

**Mr S. Miyata**

**European Director, Research and Development  
Asahi Chemical Industry Co. Ltd.**

**54 Grosvenor St., London W1X 9FH. (W6080)A**

## University of Utrecht The Netherlands

Faculty of Biology

vac.nr.  
146.183

### professor of comparative endocrinology

Applications are invited for the chair of Comparative Endocrinology in the Department of Experimental Zoology. The research group presently performs research on the endocrine regulation – both physiologically and cell biologically – of the reproduction in teleosts. The group collaborates with other research groups of the Department of Experimental Zoology, with the Department of Fish Culture and Fisheries of the Agricultural University in Wageningen and with well-known scientists abroad.

Applicants need to have a broad knowledge and experience in comparative endocrinology and to be acquainted with modern physiological and cell biological methods.

The candidate should be willing to teach at pregraduate and postgraduate level. He or she should be willing to participate in administrative functions at different levels of the University organization.

The salary will be maximum Dfl. 9957,— per month.

Applications, including curriculum vitae, list of publications and the names and addresses of two referees, should be sent within 3 weeks to the Dean of the Faculty of Biology, prof. Dr. G.A. van Arkel, Office of the Faculty of Biology, Padualaan 14, 3584 CH Utrecht, The Netherlands: Phone 030-533133/532276.

Equal employment, irrespective of sex, is university policy.

Those wishing to recommend suitable candidates are requested to inform the Dean of the Faculty of Biology.

(W6068)A

### Hildegard Doerenkamp and Gerhard Zbinden Foundation for Realistic Animal Protection in Scientific Research Scientific AWARDS 1989 and 1990

A prize of DM 50.000,— each will be awarded for outstanding scientific contributions to the following topics:

#### Award 1989:

#### "Alternatives for Animal Experimentation in the Neurosciences and in Epilepsy Research"

Applications should consist of published or unpublished reports on alternative methods replacing animal experimentation in the neurosciences and in epilepsy. New techniques that can reduce the number of higher animals used (primates, dogs, cats) or decrease experimental stress in these animals will also be considered.

#### Award 1990:

#### "Anesthesia in Laboratory Animals— Management of Chronic Pain in Laboratory Animals"

Applications should consist of publications, manuscripts or audio-visual presentations, detailing concepts, application and success of new or refined methods leading to the reduction of pain and suffering of experimental animals in acute and chronic experiments.

Applications should be sent to:

#### Award 1989:

Prof. Dr. Diether Neubert  
Institut für Toxikologie  
und Embryopharmakologie  
Freie Universität Berlin  
Garystrasse 5  
D-1000 Berlin 33

**Deadline: February 28, 1990**

#### Award 1990:

Prof. Dr. Kay Brune  
Institut für Pharmakologie  
der Universität  
Erlangen-Nürnberg  
Universitätsstr. 22  
D-8520 Erlangen

**Deadline: February 28, 1991**

All materials remain the property of the applicants and will be returned within three months after distribution of the prize. The jury reserves the right to split the prize among not more than three applicants. No special application forms are required.

(W6083)N

SANDOZ LTD, BASEL / SWITZERLAND

congratulate

*James E. Birren*  
*Ph.D., D.Sc. U.S.A.*

*J.C. Brocklehurst*  
*M.D., Great Britain*

*David Danon*  
*M.D., Israel*

*G.S. Roth* / *J.A. Joseph*  
*Ph.D., U.S.A.* / *Ph.D., U.S.A.*

on their being awarded the

1989 SANDOZ PRIZE  
FOR GERONTOLOGICAL RESEARCH

by the Jury of the International Association of Gerontology

With this prize, the IAG honors distinguished personalities  
for their achievements in gerontological research and  
leadership in activities for the betterment of life of elderly  
fellow citizens in all parts of the world.

# Sandoz Prize for Immunology

The prize will be worth US \$ 100 000 (US \$ 20 000 personal recognition/US \$ 80 000 support for research programme), and will be sponsored by SANDOZ LTD., Basle, Switzerland with the purpose of encouraging research in all areas of immunology with special emphasis on clinical immunology, including autoimmune diseases, cancer immunology, immunity to infectious diseases, transplantation immunology and discoveries in immunology leading to therapeutical applications.

Members of the Jury are G. Ada, J.-F. Bach, T. Honjo, P. Marrak, H.O. McDevitt, J.J. van Rood, R. Zinkernagel, and two representatives of Sandoz Ltd. The prize will be awarded on the occasion of an important Immunology Meeting in 1990.

Applications in English should comprise a summary of the research work of 3–5 pages, curriculum vitae, bibliography, experimental original papers separate from reviews and chapters, and reprints of not more than 3 key published papers in English or with extended summaries in English.

Individuals and research teams are invited to submit their applications not later than 30th June, 1989 to Sandoz Prize for Immunology, P.O. Box 182, 4013 Basel, Switzerland.

(W5985)N

## Karolinska Institute

Department of Molecular Biology

### POSTDOCTORAL POSITION

#### Molecular Biology of Membrane Protein Assembly

We have an immediate opening for a postdoc interested in working on problems related to protein sorting and membrane protein assembly (see PNAS 85, 3363-3366 and BBA 947, 307-333). Our department is wholly focussed on this field, using current methods of molecular and cell biology such as site-specific mutagenesis and *in vitro* transcription-translation assays. Applicants should therefore have a good background in molecular-biology or microbiology.

Salary is 5500 Skr per month tax free (approx £500); in addition, apartment rent, health insurance, and travel costs are covered. The Department of Molecular Biology is a part of the Karolinska Institute and is located alongside the Karolinska Center for Biotechnology in Huddinge, south of Stockholm.

Please address all enquiries to: **Dr. Gunnar von Heijne, Department of Molecular Biology, Karolinska Institutet, Huddinge Hospital-K87, S-141 86 Huddinge, Sweden. Phone: Int + 46-8-774 7699 (W6091)A**

The International Association of Biological Standardization will hold its 21st Congress at

Annecy, France on October 4-6, 1989, with the title:

### "PROGRESS IN ANIMAL RETROVIRUSES."

The subject will be exclusively devoted to the:

1. retrovirus status of cells and animals used for assays,
2. evaluation of detection methods,
3. immunization and biotherapy approaches, and
4. relevance to human retroviruses infections.

For further information, you may contact:

**Dr. Daniel Gaudry**  
Secretary of the 21st Congress of the IABS  
254, rue M. Merieux  
69007 LYON – FRANCE  
Tel: 33.72.72.30.25  
Fax: 33.72.72.33.68

(W6070)A

## RESEARCH GROUP LEADER IN MOLECULAR BIOLOGY/VIROLOGY

Our team is primarily engaged in research on experimental antiviral chemotherapy, concentrating on evaluation of efficacy and mode of action and cellular kinetics of new antiretroviral drugs. The laboratory supports ongoing and future clinical drug evaluation trials (HIV cultures, development of PCR) and collaborates with other research groups at the University of Zürich and the Federal Institute of Technology (ETH).

The ideal candidate (Ph.D. required) is expected to act as group leader and should have demonstrated experience in the performance and management of basic research projects. Knowledge of the German language is not an essential, but helpful prerequisite.

The position is available from July of 1989. Please send curriculum vitae with names and addresses of three references to: **Ruedi Lüthy, M.D. Chief, Division of Infectious Diseases, Department of Medicine, University Hospital, CH-8091 Zurich, Switzerland. (W6097)A**

## Protein Purification Courses

### Practical Course Programme 1989

#### – European Consultancy –

**1. Strategies of Recombinant Protein Purification**  
recombinant human Superoxide Dismutase (rh SOD)

4-day practical course including process development optimization, scale up, and analytical purity checking techniques

**Dates:** May 29-June 2, in English  
December 4-8, in English  
December 11-15, in German

**2. Downstream Purification: Aspects of Validation of Chromatographic Processes**

One and a half day theoretical seminar on validation strategies of process chromatography. Aimed at people responsible for process design, pilot plant, and production facilities

**Date:** open

**For further information please contact:**

**Pharmacia LKB Biotechnology**  
**European Consultancy, Birgit Roth**  
**Munzinger Strasse 9, D-7800 Freiburg**  
**West Germany**  
**Telephone: 49-761-4903152**  
**Telefax: 49-761-4903159**

**3. Protein Purification, Process Development, Optimization, and Scaling up**

4-day practical course leading to production scale chromatography (42 litre columns)

**Dates:** July 17-21, in Italian  
September 18-22, in French  
October 23-27, in English  
October 30-November 3, in English  
November 6-10, in German

**4. Process Scale Practical Course on Monoclonal Antibody Purification**

2-day course using new dedicated monoclonal purification media, software package, and instrumentation

**Dates:** June 15-16, in English  
October 16-17, and 19-20, in English  
November 27-28, 1989, in German  
November 30-December 1, in English

### INTERNATIONAL CONFERENCE

#### "THE GASTROINTESTINAL EPITHELIUM"

**September 24-28, 1989, RIOM, France**

**Organizing Committee:** K. Haffen, M. P. Hauri, M. Laburthe, M. J. M. Lewin, D. Swallow, G. Willems.

**Program:** Cell biology and molecular genetics of differentiation. Differentiation markers. New models for the study of GI epithelial cell differentiation. Maturation, growth and cell renewal. Cell renewal and carcinogenesis. Mechanisms and regulations of transport. Receptors. Interactions between the gastrointestinal epithelial cells and the immune system.

Further details: Nature, 1989, April 6, classified 29.

**Information:** M. J. M. Lewin, "The GI Epithelium", INSERM U.10, Hôp. Bichat, 75877 PARIS CEDEX 18, France. Tel. (1) 40.25.83.90 & (1) 40.25.83.93. Fax (1) 46.27.85.36. (W6065)C

### AUTOMATED DNA SEQUENCING

**Oslo, September 18 - 23, 1989**

A practical course where three different fluorescence-based DNA sequencers as well as a film reader will be available for the comparative analysis of samples brought by the participants. Teachers include Wilhelm Ansorge, Alan Bankier, Lennart Philipson, Peter Rice, Cassandra Smith, Brian Sproat and Tom Kristensen.

The course will this give a good theoretical background for modern sequencing methods as well as hands-on experience with sequencers currently in or near the market.

Applications before June 1 to: Tom Kristensen, Research Institute for Internal Medicine, Rikshospitalet, 0027 OSLO 1, Norway. Telefax: (02) 201401. (W6076)C

### THE PARENTERAL DRUG ASSOCIATION PRESENTS COURSES IN FRANKFURT FOR THE HEALTH CARE INDUSTRIES FROM JUNE 12-JUNE 16 1989

1. From gene to product: fundamentals of biotechnology
2. Biotechnology plant design
3. Aseptic processing audits
4. Sterile manufacture with blow/fill/seal technology
5. Clean room management
6. Fundamentals and concepts of calibration and metrology
7. Validation of aseptic pharmaceutical processes
8. Validation of non-aseptic pharmaceutical processes

# RESEARCH COORDINATORS

## THE COMPANY

Innogenetics is a leading European biotechnology company employing over 100 highly qualified researchers. In a creative research environment, they are applying recombinant DNA technology to develop innovative drugs and diagnostics. Important areas of research are Alzheimer disease, Aids, Atherosclerosis, Wound Healing and Bone Disorders.

## THE JOB

Innogenetics has now openings for several research coordinators in the field of infectious diseases, cardiovascular diseases, neurological diseases, clinical immunology and endocrinology. Reporting to the scientific director, the successful applicants will co-ordinate the activities of the various on-site research efforts with those of collaborative projects in external laboratories. The research coordinators will optimise the use of human and financial resources and participate in the selection of new projects in their particular field of research. They will also establish and manage the necessary academic interactions to explore the potentials of new in-house developed molecules and interact with Innogenetics' business department.

## THE CANDIDATE

Successful applicants will have acquired a Ph.D. or M.D. qualification and have at least 5-10 years postdoctoral experience in one of the above mentioned research areas. Previous management of a scientific team or leadership of an academic research laboratory is highly desirable. Exceptional communication, interpersonal and supervisory abilities are also necessary as well as a thorough understanding of modern biotechnology and working knowledge of patent regulations. Fluency in English is a prerequisite and a working knowledge of Dutch, French and German would be helpful.

## THE OFFER

Innogenetics offers a remuneration in keeping with the importance of this position, including a benefits package and relocation assistance in addition to an excellent salary. The extremely pleasant research headquarters of Innogenetics is located in Ghent, an attractive middle-age city in the heart of Europe and only 40 miles away from the Belgian coast and neighboring countries.

Qualified applicants should send a c.v., including references, to **Personnel Division, Innogenetics N.V., Industriepark Zwijnaarde 7, bus 4, 9710 GENT, Belgium.** (W6100)A

### University of Geneva announces an opening for a position of a FULL PROFESSOR in

#### COMPUTATIONAL CONDENSED MATTER PHYSICS

The new professor will have the responsibility for research and teaching in computational condensed matter physics. He will in particular have the task to develop the research activities of the "Institut Romand de Recherches Numériques en physique des Matériaux" (IRRMA) situated at the campus of the "Ecole Polytechnique Fédérale de Lausanne". He will assume the direction of this Institute for a certain number of years and it is also expected that he actively participates in the scientific and academic life of the University of Geneva.

The applicant should have a Ph.D. in physics or an equivalent degree. Experience in teaching, leading and management of research groups as well as some experience in university administration is desirable. Letters of application, a curriculum vitae and a list of publications should be addressed before June 30 1989 to:

**Secretariat de la Faculté des Sciences,  
20, quai Ernest-Ansermet,  
CH-1211 Geneva 4, Switzerland**

where additional information may be obtained.

(W6072)A

## EUROPEAN SOUTHERN OBSERVATORY

Organisation Européenne pour des Recherches Astronomiques dans l'Hémisphère Austral Europäische Organisation für astronomische Forschung in der südlichen Hemisphäre

## FELLOWSHIP AT LA SILLA

A position is available at La Silla for a post-doctoral fellow with an interest in observational astronomy. Experience with IR instrumentation or optical photometry will be an advantage.

The successful applicant will be expected to spend not more than 50% of his/her time in support related activities and the rest of the time doing scientific research. The presence at La Silla will be for at least 150 nights per year. ESO fellowships are granted for a period of one year normally renewed for a second period and exceptionally renewed for a third and final year.

The facilities on La Silla consist of 15 telescopes including the SEST 15-m submillimeter antenna, and the new 3.5m NTT. The computing facilities comprise an HP1000 system with full image processing capabilities (IHAP), a VAX 11/750 mainframe, and three SUN 4/110 workstations for image processing (MIDAS).

Close to 20 astronomers, including staff members, fellows and students, work at La Silla. The research projects currently pursued by the astronomical staff at La Silla include low mass star formation (Herbig-Haro objects, molecular outflows, T Tauri stars), OH/IR stars, symbiotic stars and proto-planetary nebulae, coronal activity in late type stars, chemistry of molecular clouds, formation of massive stars, and starburst activity, dynamics of elliptical galaxies, active nuclei, QSOs and gravitational lensing, and observational cosmology.

Applicants normally should have a doctorate awarded in recent years. The monthly basic salary will be not less than DM 4190 to which are added 7% for pension purposes and a non-resident allowance of 30-45% as well as a mountain allowance of 5-10%. Applications should be submitted to ESO not later than May 15, 1989. Applicants will be notified in July 1989. The ESO Fellowship Application Form should be used and be accompanied by a list of publications. In addition, three letters of recommendation should be obtained from persons familiar with the scientific work of the applicant. These letters should reach ESO not later than May 15, 1989.

Enquiries, requests for application forms and applications should be addressed to: **European Southern Observatory, Fellowship Programme, Karl-Schwarzschild-Straße 2, D-8046 GARCHING b. München, Federal Republic of Germany** (W6094)E

## UNIVERSITE DE LAUSANNE

Professor of Anatomy  
Faculty of Medicine

A full-time is opened for an established scientist capable of teaching macroscopic and topographical anatomy to medical students. Teaching at undergraduate levels is in French but a period of adjustment can be granted.

The successful candidate is expected to develop a strong, independent and externally fundable research program. Collaborative opportunities exist in several areas including neurobiology.

The letter of application, curriculum vitae, description of current and future research plans of most significant publications should be sent copies by July 1st, 1989 to: **M. le Professeur Y. Saudan, Doyen de la Faculté de Médecine, rue du Bugnon 9 - CH - 1005 Lausanne.** (W6109)A

# Our reputation in your hands

## Senior Quality Assurance Assessors

Walton Oaks

Surrey

Already one of Britain's leading pharmaceutical companies, the Beecham Group is expanding its research and development programme. This has created vacancies for Senior Quality Assurance Assessors whose key responsibility is to ensure that our work achieves the demanding standards dictated by the regulatory authorities, and that new compounds have the highest possible chance of success. These roles will have important implications for Beecham's future.

You will audit data, carry out study inspections, assess facilities and interpret national and international guidelines to meet GCP standards. Your background will ideally be in QA auditing to GLP/GCP standards, clinical research or nursing. Strong personal and analytical skills will help you influence international clinical teams – skills that should

include the confidence to operate independently when the occasion demands it. A driving licence is necessary as the work will involve travel, including overseas site visits as required.

In return we will provide an excellent starting salary, a non-contributory pension scheme, free life assurance and, after a qualifying period, an attractive Company bonus. Generous relocation assistance may be available in appropriate circumstances.

Please send a full CV, including current salary and quoting reference 13/89, to the Personnel Manager, Beecham Pharmaceuticals Research Division, Honeypt Lane, Stock, Essex CM4 9PE, or ring (0279) 622624 (24 hour answering phone) for an application form.

# Beecham

## Pharmaceuticals

(9134)A

### Faculty Position Department of Pathology McMaster University

The Department of Pathology at McMaster University seeks a research scientist to fill a faculty position in the newly established Hemoglobino-pathy Molecular Diagnostic Laboratory. The candidate should have a Ph.D. degree and demonstrated ability to carry out independent as well as collaborative research in molecular genetics and/or developmental biology, broadly related hemopoietic disorders.

The appointment will carry an appropriate faculty rank in the University at the level of Assistant/Associate Professor, will be for an initial period of three years, and carry a salary commensurate with prior experience and qualifications.

Please forward an application with curriculum vitae, names of two referees, and summaries of current and future research plans to **Dr. David H.K. Chui, Department of Pathology, McMaster University Health Sciences Centre, 1200 Main Street West, Hamilton, Ontario, Canada L8N 3Z5. (NW3659)A**

### MEDICAL RESEARCH COUNCIL TUBERCULOSIS AND RELATED INFECTIONS UNIT POSTDOCTORAL IMMUNOLOGIST

Applications are invited for the appointment of a postdoctoral (non-clinical or clinical) MRC staff scientist for a period of 3 years with the possibility of an extension of up to 5 years. The candidate is expected to have experience in basic immunology and an interest in the immunobiology of infections with intracellular bacteria. The proposed research project is to study the specificity and MHC-restrictions of the human immune repertoire to mycobacterial protein antigens. Antigens and epitopes relevant to protection or pathogenicity are to be identified by the assay of CD4 T cells in infected healthy and diseased individuals to antigenic fractions and synthetic peptides. Technical and collaborative support for the project will be available within and outside the Unit. Applications and inquiries should be addressed to **Dr. J. Ivanyi, Director of the MRC Unit, Royal Postgraduate Medical School, Hammersmith Hospital, DuCane Road, London W12 0HS, Telephone: 01-740-3161, FAX, 01-743-3987. (9098)A**

### POST-DOCTORAL RESEARCH

#### in Protein Biochemistry/Molecular Palaeontology

Applications from the UK and overseas are invited for a three-year post-doctoral research position from late 1989 to investigate proteins from shells and bones and their preserved remnants in fossils. The work will be carried out in new purpose-built laboratories housing a complete range of biochemical equipment, including amino acid analyser and micro-sequencer (ABI), liquid chromatography (Waters 650), and facilities for polyclonal and monoclonal antibody production (Dynatech). The successful applicant will join a rapidly-expanding research group which has already demonstrated the considerable evolutionary and palaeontological significance of skeletal molecules in one invertebrate phylum and has now received funding to allow detailed biochemical investigation in a wider range of taxa. Expertise in purifying and determining the structure of proteins is essential, and the Post-Doc will also be expected to assume some responsibility for the day-to-day running of the laboratories, and to help train new personnel. A competitive salary will be offered, and applicants should send a complete cv including the names of two academic referees to **Dr G.B. Curry, Dept of Geology and Applied Geology, University of Glasgow, Glasgow, G12 8QQ, Scotland (Tel: (041) 330 5444; Fax: (041) 330 4808; E-mail: gcurry@uk.ac.glasgow.geology). (9089)A**

### ASSISTANT PROFESSOR

#### Department of Ophthalmology and Visual Science Yale University School of Medicine

Full time academic appointments are available for independent investigators with the possibility of joint appointments with basic science department. Areas of interest include, but are not restricted to, photoreceptor-RPE interactions, immune functions of ocular cells, axonal transport and regulation of RPE cell proliferation and motility. Excellent facilities and environment are available to allow development of a vigorous research program using modern cellular and molecular approaches. Please send curriculum vitae, statement of research interests, and names of three references to: **Chairman, Search Committee, Department of Ophthalmology and Visual Science, Yale University School of Medicine, P.O. Box 3333, New Haven, CT 06510-8061. Affirmative Action/Equal Opportunity Employer. (NW3652)A**

**UNIVERSITY OF SOUTHAMPTON**  
Department of Biochemistry  
**POSTDOCTORAL RESEARCH FELLOW**

Applications are invited for a Postdoctoral Fellow to join a group studying the insulin receptor tyrosine kinase and the role of protein phosphorylation in cellular transduction of the insulin signal. The focus of the project will be the identification, structure and regulation of protein (phosphotyrosyl) phosphatases active in this system. Experience in one or more of the following: protein purification, enzymology or cell biology, would be an advantage.

The appointment is for a period of three years and will be at an appropriate point on the University Grade 1A scale. The post is funded by the British Diabetic Association.

Applications, including a curriculum vitae and the names and addresses of two referees should be sent to **Dr G. J. Sale, Department of Biochemistry, University of Southampton, Bassett Crescent East, Southampton SO9 3TU.** (9125)A

**POSTDOCTORAL FELLOW NEUROSCIENCES**

Intracellular electrophysiological in vitro experience preferred. Join large multi-disciplinary research group investigating pathophysiology of traumatic brain injury. Research to include studies of hippocampal function after injury. Opportunities to develop innovative research program with close linkage to molecular studies. Minimal appointment of 2 years. Salary negotiable. Contact:

**Stephen J. Goldberg, Ph.D., Department of Anatomy, Box 709, Medical College of Virginia/ Virginia Commonwealth University, Richmond, VA 23298. Telephone: 804-786-9529.**

(NW3648)A

**THE UNIVERSITY OF LEEDS DEPARTMENT OF PHYSICS LECTURER (N.A.A.S. funded)**

Applications are invited for the above post available from 1 September 1989. The lecturer will be expected to carry out research in the field of experimental ultra high energy gamma ray astronomy based at Haverah Park.

Salary will be on the Lecturer Grade A scale (£9260-£14500) or Grade B (£15105-£19310), according to qualifications and relevant experience.

Application forms and further particulars may be obtained from and completed applications forwarded to the Registrar, The University, Leeds LS2 9JT, (tel (0532) 333963) quoting reference no. 52/48. Closing date for applications 18 May 1989. (9108)A

**UNIVERSITY OF MANCHESTER DEPARTMENT OF BIOCHEMISTRY & MOLECULAR BIOLOGY**

**POSTDOCTORAL RESEARCH ASSOCIATE**

Applications are invited for a 3-year post based in the School of Biological Sciences and financed by the Wellcome Trust to study the biochemistry of the extracellular matrix in normal and diseased connective tissues. Work will involve studying the interaction of connective tissue components with fibrils formed *in vitro* from normal and mutated collagens using a newly developed system. Experience in protein purification and physical biochemical methods would be an advantage but not essential. Starting date September 1st. Salary range £9,865-£11,680 p.a. Superannuation. Applications (in duplicate) with a full c.v. and the names of two referees to: **Dr K. E. Kadler, Department of Biochemistry & Molecular Biology, the University, Manchester M13 9PT** by June 1st, 1989. The University is an equal opportunities employer. (9077)A

**UNIVERSITY OF EXETER DEPARTMENT OF BIOLOGICAL SCIENCES**

**RESEARCH FELLOW (PLANT PHYSIOLOGIST)**

Applications are invited for the above post for research into the mechanisms of Arsenic tolerance in the grass *Holcus lanatus*. The project will involve the study of the uptake of arsenate and phosphate and their interaction. The position will commence on June 1st, or as soon as possible thereafter for a period of three years. Starting salary £9865 (under review).

Applications with the names of two referees, should be sent to **Dr M R Macnair, Hatherly Laboratories, Department of Biological Sciences, University of Exeter, by May 16th**, from whom further particulars may be obtained. (9079)A

**POSTDOCTORAL POSITION**

**MOLECULAR NEUROBIOLOGY**

Immediate opening on NIH grants to study the neurotrophic effects of the insulin-like growth factor gene family, nerve regeneration, synaptogenesis, or pathogenesis of diabetic neuropathy. Location near scenic Rocky Mountains. Submit curriculum vitae with names and phone numbers of three references to: **Dr. Douglas Ishii, Physiology Department, Colorado State University, Fort Collins, CO 80523.** CSU is an Equal Opportunity/Affirmative Action Employer (NW3667)A

**MICROBIOLOGIST/IMMUNOLOGIST**

A full-time tenure track position is available in the Faculty of Dentistry's Department of Oral Biology with a joint appointment in the Faculty of Medicine's Department of Microbiology. Candidates must possess doctoral level education in microbiology, immunology, or a related field of study. Teaching and research experience in the microbiological and/or immunological aspects of oral diseases is preferred. Responsibilities include course administration and teaching of oral microbiology and immunology to dental, dental hygiene and graduate students. Collaborative research with dental and dental hygiene faculty members is strongly encouraged. Rank and salary will be commensurate with qualifications and experience. Interested applicants should send Curriculum Vitae and three reference letters by 30 June 1989 to **Dr. R. Howell, Acting Chair, Department of Oral Biology, Faculty of Dentistry, Dalhousie University, Halifax, Nova Scotia B3H 3J5.** In accordance with Canadian immigration requirements, this advertisement is directed to Canadian citizens and permanent residents.

Dalhousie University has a policy of affirmative action in hiring qualified women academic staff. (NW3657)A

**ASSISTANT PROFESSOR/INSTRUCTOR/STAFF ASSOCIATE.**

Available immediately to join the Immunogenetics Laboratory with interest/experience in HLA and/or lymphocyte differentiation antigens.

Requirements: Ph.D. and 3 years of postdoctoral training in molecular genetics.

Send curriculum vitae and bibliography to:

**Dr. Nicole Suciu-Foca, College of Physicians and Surgeons of Columbia University, Department of Pathology, Dept. NT P & S 14-403, 630 West 168th Street, New York, NY 10032.**

(NW3638)A

**Two Postdoctoral Positions in Protein Crystallography and Engineering**

One position is for a macromolecular crystallographer to work on cytochrome P-450 and related systems. The second is for a biochemist/biochemist interested in working with molecular biologists and crystallographers on heme enzyme protein engineering. Contact

**Dr. T.L. Poulos, University of Maryland's Center for Advanced Research in Biotechnology, 9600 Gudelsky Drive, Rockville, Maryland 20850.**

(NW3643)A

**THE UNIVERSITY OF LEEDS DEPARTMENT OF PHARMACOLOGY**

**POSTDOCTORAL RESEARCH FELLOW**

Applications are invited for the above post for work on an MRC co-operative project investigating the protective effects of adenosine antagonists in acute renal failure.

Candidates must possess a PhD or relevant experience. The appointment is for one year.

Salary within the range £9865-£11070 on the IA Grade for R/A staff according to qualifications and relevant experience.

Informal enquiries may be made to either **Dr C J Bowmer** or **Dr M S Yates** (tel (0532) 334315/6).

Application forms and further particulars may be obtained from and completed applications forwarded to the Registrar, the University, Leeds LS2 9JT, quoting reference no. 103/13. Closing date for applications 18 May 1989. (9122)A

**POSTDOCTORAL RESEARCH ASSOCIATE**

**Mechanism of HIV Cytopathicity**

Position available to participate in studies on mechanism in HIV mediated cytopathicity and mechanisms of viral persistence in AIDS (Stevenson et al, Cell 53: 483-496, 1988). Experience in molecular biology is desirable. C.V. & 3 letters of recommendation to **Mario Stevenson, Ph.D., Pathology & Microbiology, University of Nebraska Medical Center, 42nd & Dewey Ave., Omaha, NE 68105** by 8-1-89.

An Affirmative Action/Equal Opportunity Employer.

(NW3645)A

**POST DOCTORAL RESEARCH ASSOCIATES**

Positions are available for candidates with experience in smooth muscle physiology, biochemistry, cell and molecular biology to work on eicosanoids regulation of human myometrial functions. Some experience in eicosanoids research would be helpful. Address inquiries to **Dr. Ch. V. Rao, Dept. of Ob/Gyn, 438 MDR Bldg., University of Louisville, Louisville, KY 40292.** (NW3639)A

**POST-DOCTORAL POSITIONS**

available immediately to work on the molecular biology and immunology of the parasites that cause the major tropical diseases. Send resume and three letters of reference to **Dr. John E. Donelson, Dept. of Biochemistry, University of Iowa, Iowa City, IA 52242 USA.**

The University of Iowa is an EO/AA employer. (NW3640)A

## UNIVERSITY OF MINNESOTA ASSISTANT PROFESSOR

The University of Minnesota invites applications for one full-time position in the field of human population genetics at the rank of assistant professor (tenure-track). The position will have a primary appointment in the Department of Laboratory Medicine and Pathology and a joint appointment in the Institute of Human Genetics. Candidates with a Ph.D. and/or M.D. with advanced training in population genetics or related disciplines, plus 2 years of relevant post-doctoral experience that includes human gene mapping or complex segregation analysis will be considered. Candidates will be expected to develop a vigorous, independent research program; participate in teaching; and interact with Institute members in the development of the Institute. Requirements: In-depth knowledge of multilocus linkage analysis; complex segregation analysis and/or evolution at the molecular level. Please send curriculum vitae; a short description of research plans; and three letters of recommendation to: **Chair, Search Committee, Institute of Human Genetics, University of Minnesota Medical School, Box 206(N), UMHC, Harvard Street at East River Road, Minneapolis, MN 55455.** The last date for receipt of applications is 31 July 1989. *The University of Minnesota is an Equal Opportunity Educator and Employer and specifically invites and encourages applications from women and minorities.*

(NW3663)A

## Molecular Biology Growth Regulation

The Division of Hematology-Oncology, Department of Pediatrics at Childrens Hospital of Los Angeles, and the Departments of Pediatrics and Biochemistry, of the University of Southern California School of Medicine are seeking an established Molecular Biologist whose investigation is in the area of growth regulation of normal and malignant hematopoietic cells. This investigator should be able to develop and direct an outstanding laboratory program as well as interact with individuals performing clinical/laboratory investigations. The job profile includes teaching in hematology-oncology and biochemistry (20%), and laboratory investigation (80%).

The candidate must have a proven ability to obtain peer-received grant research funding. Substantial institutional support is available for this individual.

Interested candidates should send a curriculum vitae and list of three references to: **Dr. Robert C. Seeger, M.D., Division of Hematology-Oncology, Childrens Hospital of Los Angeles, 4650 Sunset Boulevard, Los Angeles, California 90027.**

The University of Southern California and Children's Hospital of Los Angeles are Equal Opportunity Employers.

(NW3675)A

## SENIOR RESEARCH CHEMIST

### Make The Most Of Your Chemical Expertise In Our Advanced Research & Development Climate.

At BERLEX Laboratories, a growing leader in the pharmaceutical industry, our commitment to R & D has never been stronger. As a result, we're currently seeking Chemists who want to maximize their talents in our progressive scientific environment.

The incumbent will be responsible for the operation of a stability laboratory and for quality control of clinical materials in the R & D division. Provides scientific and regulatory expertise for the conduct and/or review of all stability studies for IND, NDA, and ANDA submissions. Also, as necessary, will set up contracts with outside testing laboratories for the conduct of stability studies. Required is a Ph.D. in chemistry, pharmacy, or related science, with 2-5 years experience or equivalent. Must have knowledge of FDA regulations and industry practices related to stability testing and quality control. Good interpersonal communication skills are necessary for collaboration with pharmaceutical product and process development personnel. Knowledge of computers would be valuable.

In addition to the constant challenge of discovery, we provide a generous salary and benefits package including comprehensive medical & dental coverage and 100% tuition reimbursement, with ample opportunity for growth. For consideration, send your resume with salary history and requirements to: **MARILYN HUNDLEY, Manager Human Resource Operations, BERLEX LABORATORIES, INC., 300 Fairfield Road, Wayne, New Jersey 07470.** Equal Opportunity Employer M/F.

NW(3649)A

**BERLEX**  
Laboratories, Inc.

## Regulatory Toxicologists (Senior and Postdoctoral)

The Agricultural Research Division of American Cyanamid Company has a long-standing and highly successful commitment to the discovery and development of products to improve worldwide crop and livestock production. We are growing rapidly and currently have the following opportunities at our laboratory and experimental farm complex ideally located near Princeton, one hour from New York City and Philadelphia.

### Senior Toxicology Program Manager

The successful candidate will have a PhD in Toxicology or related medical field and 3 to 5 years of industrial, government or contract laboratory experience in toxicology. Knowledge of whole animal toxicology is essential. You will design, monitor and review the full range of toxicity testing performed in-house or on-contract for EPA and FDA registrations of pesticides and animal drugs.

### Postdoctoral in Regulatory Toxicology

We offer a postdoctoral position which requires a PhD in Toxicology or related medical field.

American Cyanamid offers a competitive compensation and benefits package. For prompt and confidential consideration, please forward your resume and salary history, indicating the position of your specific interest, to the Employment Office, Dept. NA-427, American Cyanamid Company, Agricultural Research Division, P.O. Box 400, Princeton, New Jersey 08540. An Equal Opportunity Employer, M/F/H/V.

THE COMMITMENT GROWS EVERY DAY.

NW(3655)A

# UNIVERSITY OF NATAL

PIETERMARITZBURG,  
SOUTH AFRICA

The University of Natal rejects apartheid. It is an equal opportunity, affirmative action University.

## Department of Microbiology and Plant Pathology

### Professor in Microbiology

Ref. P27/89

Closing date: 9 June 1989

A doctorate in Microbiology is essential. Research experience in aspects of modern industrial microbiology or biotechnology will be a strong recommendation.

Applicants must be able to provide academic leadership and should have a proven record of achievement in teaching, postgraduate supervision and research.

Current research interests in the sub-Department centres around industrial microbiology, especially the utilisation of agricultural waste materials.

The salary offered will be determined according to the qualifications and/or experience of the successful applicant.

Application forms, details of the salary package, further particulars of the post and conditions of service are obtainable from the Personnel Section University of Natal, P O Box 375 Pietermaritzburg, 3200, South Africa, telephone (0331) 63320 or The Secretary, South African Universities Office, Second Floor, 16 Charles II Street, London SW1Y 4QU. Telephone 01-839 3420 or 01-839 4388. Fax 01-839 3480. (W6087)A

## UNIVERSITY OF BRISTOL DEPARTMENT OF MICROBIOLOGY

Applications are invited for a

### Research Assistant 1B

post to be taken up as soon as possible. The appointment ends 30th December 1991.

We are studying the survival of the bacterium *Rhizobium* in Italian soils as part of a collaborative project with scientists in Ireland and Italy.

We will set up database of information about important characteristics of the rhizobia and environment from which they are isolated, to correlate survival with particular environmental features, such as soil pH or cropping history.

The position is suitable for a graduate in biology with some experience of IBM-compatible personal computers. Training will be given to a particularly well qualified biologist, if needed.

Informal enquiries may be made to Professor J E Beringer on Bristol (0272) 303759.

For further details telephone Bristol 303136 (ansaphone after 5.00 p.m.) or write to the Personnel Office, Senate House, Bristol BS8 1TH. Please quote reference A368.

An Equal Opportunities employer.

## ST GEORGE'S HOSPITAL MEDICAL SCHOOL (University of London)

### POST-DOCTORAL RESEARCH FELLOW

required for a 3 year project involving the development of human retroviruses as eukaryotic gene vectors, and evaluation of viral packaging mechanisms. Technical support will be provided. Excellent facilities available. A background in molecular biology is required.

Salary up to £11,680 plus £1,650 London allowance in scale 1A for University Research Staff (under review). Further details and an application form from the Personnel Officer, St George's Hospital Medical School, Cranmer Terrace, London SW17 0RE, 01-672 9944 ext 56020. Closing date 19 May 1989. Please quote reference 55/89. (9092)A

## The Wellcome Trust/ Cancer Research Campaign Institute of Cancer and Developmental Biology

UNIVERSITY OF CAMBRIDGE, ENGLAND

This new research Institute is now under construction in the Science area of Cambridge University. It will provide excellent facilities for some independent research groups, each funded by one of the above sponsors. We are now seeking outstanding young scientists, (currently of post-doctoral level or above) as leaders of independent groups.

The first appointments can be made this summer to be taken up when the Institute opens at the end of 1990. Appointments will be made at the Wellcome/CRC Senior Fellowship level and will be for five years in the first instance. Appointments will include funding for a small group and research expenses.

For further information on the current staff composition, aims and interests of the Institute, please write to J.B. Gurdon (Chairman), CRC Molecular Embryology Unit, Department of Zoology, Downing Street, Cambridge CB2 3EJ. Telephone (0223) 323316.

The University follows an equal opportunities policy. (9096)A

## Senior Technician Grade 8C (Molecular Biology/Genetics and Biochemistry)

Salary Scale £13,575 - £14,736 inclusive of London Allowance

This is a newly created post in the School of Biological and Health Sciences responsible for providing a state-of-the-art service and contributing to the development of improved methods of experimental biochemistry, gene manipulation and molecular biology. Applicants should have a degree or equivalent qualification and relevant experience.

Please telephone 01-580 2020 ext 2136 (answerphone) for an application form and further details or write to Personnel Department, PCL, 309 Regent Street, London W1R 8AL quoting Ref 10402. Closing date for the receipt of completed application forms is 18 May 1989.

PCL is an Equal  
Opportunities  
Employer.

## CELL BIOLOGY LABORATORY RESEARCH ASSISTANT

required to join an expanding team led by Professor Michael O'Shea investigating the molecular biology and biochemistry of peptide hormones in insects.

The successful applicant will participate in studies of the structure and biosynthesis of precursor proteins of insect neuropeptide hormones. A degree in Biochemistry, Molecular Biology or a related discipline is required and Postdoctoral applicants with suitable experience are encouraged to apply. Experience with DNA sequencing and cloning methodologies would be an asset. Applicants with experience of protein and peptide purification and protein chemistry will also be considered.

Applicants may telephone Professor O'Shea on 0784 39970 to discuss the specifics of the research project and to arrange an informal visit to the laboratory, if required.

Application forms may be obtained from the Personnel Office, RHBNC, Egham Hill, Egham, Surrey. TW20 0EX. Closing date for receipt of applications is 19th May 1989. (9118)A

## OCEAN DRILLING PROGRAM TEXAS A&M UNIVERSITY STAFF SCIENTIST

The Ocean Drilling Program at Texas A&M University invites applications for the position of Staff Scientist in the Department of Science Operations. Applicants must have a Ph.D. in geology or related field and a strong background in marine geology. Experience as a seagoing scientist is preferred. Applicants must demonstrate fluency in written and spoken English. Responsibilities include sailing on a scientific research drillship as staff scientific representative approximately once per year, and coordinating post-cruise scientific research and publication of cruise results. Individual research and interaction with colleagues in the Departments of Oceanography, Geology, and Geophysics are encouraged.

Salary is commensurate with qualifications and experience. Closing date for submitting applications is June 15, 1989. Applicants should forward curriculum vitae, bibliography, statement of research interests, and names and addresses of four (4) references to:

**Employment Manager  
Personnel Department  
Texas A&M University

# SCIENTISTS CARDIOVASCULAR RESEARCH

**COR Therapeutics, Inc.** is a recently established and rapidly growing biotechnology company located in the San Francisco Bay Area. We specialize in the development of novel therapeutics for cardiovascular disease. We are actively recruiting a few highly qualified scientists with proven track records to join our Research Department. These scientists will join a research effort directed at the study of molecular mechanisms underlying various aspects of cardiovascular disease. The primary focus will be on growth factors and growth factor receptors, and receptors mediating vascular cell interactions.

### Molecular Biology

Expression of native, chimeric and mutant proteins. Experience with mammalian cell expression preferred. Objectives will be to use a molecular approach to understand protein function and to develop the use of expressed proteins as novel pharmaceutical agents.

**COR Therapeutics, Inc.** offers competitive salaries, benefits, and attractive equity positions to its employees combined with the challenge and opportunity to make a significant contribution to this new organization. To apply, please send *curriculum vitae* to COR Therapeutics, Inc., 256 E. Grand Avenue, Suite 80, South San Francisco, CA 94080, ATTN: Human Resources. EOE. (NW3665)A

### Protein Biochemistry

Identification, isolation and characterization of structural and functional domains of ligands and receptors. Objectives will be to characterize structure-function relationships of these proteins and to use this information to develop receptor antagonists.

## COR Therapeutics, Inc.

## Postdoctoral Positions

### Harvard Medical School Dana Farber Cancer Institute and Joint Center for Radiation Therapy

A number of postdoctoral positions are available to study the malignant phenotype and its influence on responses to cancer therapy. Areas of interest include: regulation of the heat shock response and functions of heat shock proteins; effects of hypoxia on gene expression in malignant cells; role of cellular redox state in responses to cancer therapy and in pleiotropic drug resistance; growth factors and the control of hematopoietic cell proliferation; phenotypes in human mammary cancer — cell surface glycoproteins, tyrosine phosphoproteins, steroid receptors and oncogene expression; antibody-targeted cancer therapy. Applicants should have a strong training in cell biology, molecular biology or biochemistry. Applications, giving full curriculum vitae and the names of two referees to **Dr. Stuart Calderwood, Dana Farber Cancer Institute, Harvard Medical School, 44 Binney Street, Boston, MA 02115.** (NW3669)A

## PHYSICIST

Assistant Professor, tenure-track, recent Ph.D., with background in electron optical research, particularly electron energy loss spectroscopy and interest in biological applications. Opportunity also for participating in research involving confocal microscopy and microspectrophotometry. Appointment is to be made in the Department of Physiology; the Appointee will be encouraged to develop and maintain ties with the Department of Physics and/or Materials Science. The position is suited for individuals desirous of developing an independent research program as well as collaborating with cellular biophysicists in the development and application of electron and light optical methods to problems of cell biophysics. A good grasp of theory, as well as instrumentation, is required. The University of Virginia is an Equal Opportunity Employer. Please furnish curriculum vitae and résumé to: Dr. A.P. Somlyo, Chairman, Department of Physiology, Box 449, University of Virginia, Charlottesville, VA 22908. (NW3671)A

## nature

the international journal of science  
seeks a

### LOCUM PHYSICAL SCIENCES EDITOR

- For up to 16 weeks from end-May.
- To assist with manuscript selection.
- Essential requirements: first-hand research experience in physical sciences, wide interests, flexibility.

The appointment would suit an academic scientist on secondment or sabbatical.

Replies as soon as possible with full *curriculum vitae* to the Editor, *Nature*, 4 Little Essex Street, London WC2R 3LF. (9061)A

## POSTDOCTORAL POSITION

Available immediately to participate in research directed toward a molecular understanding of cell differentiation and reproduction in the filamentous fungus *Aspergillus nidulans*. Classical and molecular genetic approaches will be used to investigate the expression of essential genes and biochemical functions of gene products. Experience in molecular biology or genetics is desirable.

Send résumé and three letters of reference to: Dr. Bruce L. Miller, Department of Bacteriology and Biochemistry, University of Idaho, Moscow, ID 83843. Equal Opportunity/Affirmative Action Employer. (NW3674)A

## UNIVERSITY OF WARWICK HEAD TECHNICIAN HIV RESEARCH

The Virology Group within the Department of Biological Sciences has received a large grant from the AIDS Directed Programme of the Medical Research Council to begin on HIV. A new suite of containment laboratories will be constructed to allow the work to proceed and we are seeking to appoint a senior technician for this facility. He/she will have day to day responsibility for the running of the laboratories in addition to assisting in ongoing research projects. Applicants with experience in handling infectious agents are particularly encouraged to apply but additional training in the special requirements for handling HIV will be given.

The appointment is for three years in the first instance. Salary on the Grade 5 scale: £8088-£9549.

Informal telephone enquiries concerning this post can be made to Dr M A McCrae on 0203-523524.

Application forms from the **Personnel Office, University of Warwick, Coventry CV4 7AL** (0203 523685) quoting Ref No 35/T/88 (please mark clearly on envelope).

Closing date for applications 15 May 1989.

**AN EQUAL OPPORTUNITIES EMPLOYER (9086)A**

ROYAL HOLLOWAY AND BEDFORD  
**NEW COLLEGE**  
University of London

### DEPARTMENT OF BIOCHEMISTRY

Applications are invited for the position of

## Postdoctoral Research Assistant

to work with Dr C C Rider on the binding of lymphokines by the glycosaminoglycans of lymphoma cells and lymphocytes. Glycosaminoglycans are long, linear chains of carbohydrate, and they exhibit structural differences between the B and T cell lineages. This project is funded by the leukaemia Research Fund for 2 years and is available as soon as possible.

Applicants should possess or be expecting to gain a PhD in Biochemistry, Immunology or Cell Biology.

The work will involve fractionation of the glycosaminoglycans synthesized by lymphoma cell lines and the determination of lymphokines by bioassay or immunoassay.

Salary on the scale £11,515 - £17,370 a year including London allowance. Informal enquiries may be made to Dr C C Rider, Department of Biochemistry, (0784 34455 ext. 3548).

Application forms are available from the **Personnel Office, RHBNC, Egham Hill, Egham, Surrey. TW20 0EX. Completed applications should be returned by 17th May 1989.** (9071)A

## POSTDOCTORAL POSITION

Study the cellular basis for auditory information processing and synaptic organization of auditory brainstem. Use axonal transport, EM autoradiography, EM immunocytochemistry, electrophysiology, and intracellular staining. Participate in high-tech program to use image processing and 3D-computer graphics in neuroanatomy. Ph.D. in neurobiology or equivalent required plus experience in neuroanatomy, EM, or neurophysiology. Join an exciting interdisciplinary group.

To apply, send curriculum vitae and reference to: **Dr. Douglas L. Oliver, Department of Anatomy, University of Connecticut Health Center, Farmington, CT 06032.**

*An Affirmative Action/Equal Opportunity Employer M/W/H.* (NW3641)A

## BOTANIST

Bishop Museum is seeking an assistant/associate botanist to conduct original systematic and evolutionary research on Hawaiian and tropical Pacific flowering plants and to provide expertise on Hawaiian plants to the scientific community and public. This is a Bishop Museum-funded position. Candidates must have a PhD degree and preferably some experience with floristic botany. Send curriculum vitae and letter of application to: Research Botanist Search Committee, Bishop Museum, PO Box 19000-A, Honolulu, HI 96817-0916. An Equal Opportunity Employer. (NW3672)A

## The DEPARTMENT OF PATHOLOGY of the UNIVERSITY OF MONTREAL Medical School invites applications for the following faculty position:

A) Associate or full professor M.D. and/or Ph.D. with experience in research in oncology and molecular biology. The selected candidate will be expected to act as the scientific coordinator of a developing group in oncogenetic research and to share teaching responsibilities, mostly at the graduate level. A good knowledge of the french language is preferable. Salary will be commensurate with academic level.

B) Research professor M.D. and/or Ph.D. interested in developing research in molecular genetic or molecular biology. The candidate will integrate a research group in oncogenetics and will share responsibilities in teaching at all levels. The candidate's profile should allow competitiveness for the obtention of external research funds in the two years following his or her arrival. A good knowledge of the french language is preferable.

Send curriculum vitae and the names of three referees by June 15, 1989 to: **Dr. Jean Michaud, Chairman, Department of Pathology, Université de Montreal, P.O. Box 6128, Station "A", Montreal, Quebec, H3C 307.**

In accordance with Canadian Immigration requirements, this advertisement is directed in priority to Canadian citizens and permanent residents of Canada. The University of Montreal is an equal opportunity employer.

(NW3664)A

## CITY & HACKNEY HEALTH AUTHORITY

QUEEN ELIZABETH  
HOSPITAL FOR CHILDREN,  
HACKNEY ROAD,  
LONDON, E2 8PS

"Working towards Equal Opportunities"

Applications are invited for the post of MLSO 1 in the Academic Department of Child Health Laboratories at Queen Elizabeth Hospital for Children, Hackney Road, London, E2 8PS. The successful applicant will assist with molecular biology techniques in relation to IgE synthesis in young atopics. Experience of RNA handling, tissue culture and immunoassays, particularly ELISA, desirable but not essential. Appointment initially for one year with the possibility of renewal. Salary £10,543 to £10,917 per annum.

Applications to be sent to: Joint Academic Department of Child Health at the above address, as soon as possible. (9109)A

The University of Queensland  
Brisbane, Australia

Lecturer/Senior Lecturer (Fixed Term)

Department of Physiology and Pharmacology

With higher degree and active research interests and experience in Central Nervous System (other than Sensory Neuroscience) or Muscle. Applicants should have demonstrated ability to contribute to the Department's teaching programs to students in the Faculties of Medicine, Science, Veterinary Science, Dentistry, Education and Agriculture. Appointment available from 1 January 1990.

Salary: Lecturer A\$30,737 - A\$40,100 per annum; Senior Lecturer A\$40,937 - A\$47,564 per annum.

Closing date: 16 May 1989. Reference No: 18489.

Additional information available from Professor Elspeth McLachlan (07) 377 3133, or from Appointments (36278), Association of Commonwealth Universities, 36 Gordon Square, London WC1H 0PF.

Equal Opportunity in Employment is University Policy (W6088)A

## POSTDOCTORAL POSITION SUNY STONY BROOK

Funded project for a postdoctoral to become immediately productive using available reagents and probes to study the expression of specific enzymes that control normal and malignant cell behaviour. Experience in molecular biological techniques essential. \$25,000 stipend. Send CV and references to:

**Dr. James P. Quigley, Department of Molecular and Cellular Pathology, SUNY/Stony Brook, Stony Brook, NY 11794-8691.**

*SUNY/Stony Brook is an affirmative action equal opportunity educator and employer.*

## POSTDOCTORAL AND RESEARCH ASSISTANT POSITIONS

available immediately to study immunotherapeutic approaches to treatment of experimental metastases in a mouse model. Postdoctoral applicant should have an M.D. and/or Ph.D. with a strong background in tumor immunology. Send curriculum vitae and names of at least two references to: **Dr. Jerry A. Bash, Surgical Cancer Research Laboratory, Department of Research, Mount Sinai Medical Center, 4300 Alton Road, Miami Beach, FL 33140.** (NW3637)A

**University of York  
Department of Biology**

**Postdoctoral Research Fellow**

Applications are invited for the above AFRC-funded post, available from June for a period of up to two years and two months. The project involves ion-selective microelectrode measurements on plant cells, with the aim of elucidating the role of cytosolic free calcium in growth and development. The successful candidate will join a well-equipped laboratory active in various aspects of calcium metabolism.

Starting salary within the range £9,865-£11,680 per annum.

Two copies of applications, with full curriculum vitae and naming two referees, should be sent by 16 May 1989 to Personnel Office, University of York, Heslington, York YO1 5DD, from whom further particulars are available. Please quote reference number 6/6273A.

Informal enquiries to Dr D Sanders (tel. 0904 432825) (9082)A

**UNIVERSITY OF LIVERPOOL  
DEPARTMENT OF BIOCHEMISTRY  
RESEARCH ASSISTANT**

Applications are invited from suitably qualified graduates or intending graduates in biochemistry or a related subject to work for Professor B. E. H. Maden on a grant from the Wellcome Trust for research into human ribosomal genes. The work is to explore the application of some new techniques such as genomic sequencing and the polymerase chain reaction. The post is tenable for twelve months with the possibility of renewal.

Salary within the range £8,675-£9,865 per annum.

Applications, together with the names of three referees, should be received not later than 12 May 1989, by The Director of Staffing Services, The University, P.O. Box 147, Liverpool, L69 3BX, from whom further particulars may be obtained.

Molecular Biology**

\$A31,525-\$A38,567

DIVISION OF ANIMAL PRODUCTION  
PROSPECT, NSW, AUSTRALIA.

THE DIVISION: The Division of Animal Production conducts research directed towards the general improvement in production efficiency of domestic animals. The research encompasses a wide area, including genetics, nutrition, reproduction, physiology, skin biology and immunobiology.

THE PROGRAM: One of the major programs of the Division has as its aim the genetic engineering of animals. The techniques required for the production of transgenic livestock have been established and the research is now involved in understanding the regulatory mechanisms which control foreign gene expression in transgenic animals.

THE JOB: The appointee will undertake research with a team involved in the genetic engineering of sheep and will participate in an investigation of the fundamental mechanisms which control gene expression in transgenic animals. Particular emphasis will be placed on the tissue-specific regulation of genes which have been constructed in order to introduce new metabolic pathways into transgenic sheep.

THE PERSON: Applicants should hold a PhD degree or equivalent qualifications with research achievement in biochemistry and molecular biology. Practical experience in recombinant DNA techniques is essential. Familiarity with cell culture techniques and protein chemistry would be an advantage.

CONDITIONS: Appointment will be for a term of 3 years, with Australian Government Superannuation benefits available.

MORE INFORMATION: Prospective applicants are invited to telephone Dr Kevin Ward on (02) 631 8022 for further information. Dr Ward can also provide a copy of the detailed job description and selection criteria.

APPLICATIONS: Applications should be submitted by 25th May, 1989, and quote reference No. AP89/16. They should be framed against the selection criteria, and should state relevant personal particulars including details of qualifications and experience. Applicants should nominate at least two professional referees, and address their applications to:

The Chief,  
CSIRO Division of Animal Production,  
P.O. Box 239, Blacktown, N.S.W. 2148,  
Australia.

CSIRO IS AN EQUAL OPPORTUNITY EMPLOYER

(W6084)A

**ASSISTANT PROFESSOR, MICROBIOLOGY**

The Department of Microbiology, Faculty of Medicine, Dalhousie University seeks a Ph.D. with a strong background in Microbiology and postdoctoral training preferably in Molecular/Tumor Virology to establish an independent research program and participate enthusiastically in undergraduate and graduate teaching programs. Specialists in other areas may also be considered. Interested applicants should send Curriculum Vitae, three letters of reference, and an outline of their proposed research program as soon as possible to Dr. K.B. Easterbrook, Head, Department of Microbiology, Dalhousie University, Halifax, Nova Scotia B3H 4H7. It is expected that this will be a tenure-track position and it will remain open until filled. In accordance with Canadian immigration requirements, this advertisement is directed to Canadian citizens and permanent residents. Dalhousie University has a policy of affirmative action in hiring qualified women academic staff. (NW3656)A

**nature**

— the professionals' choice

**FACULTY POSITION  
THERIOGENOLOGY: LARGE ANIMAL OR WILDLIFE**

**Position Description**

The Department of Clinical Sciences of the New York State College of Veterinary Medicine invites applications for a tenure track position in Theriogenology with responsibilities in large animal theriogenology or wildlife reproduction. The ideal candidate should possess a DVM degree or equivalent and have post-graduate research training and experience. Preference will be given to an individual with demonstrated expertise and interest in equine theriogenology or in reproduction of wildlife or endangered species. Board certification or board eligibility in the American College of Theriogenologists is highly desirable. The Theriogenology Section at Cornell currently includes five faculty positions in large and small animal theriogenology. The successful candidate will participate in the large animal clinical theriogenology service in the Veterinary Medical Teaching Hospital and the teaching of formal courses in the professional (DVM) core curriculum. The candidate will be required to develop a high quality, independent research program, and to participate in professional service and continuing education activities. Opportunities for collaborative research are excellent.

Rank and salary will be commensurate with professional and academic credentials and experience. Interested individuals should send a letter of application, curriculum vitae and names and addresses of three suitable referees to **Dr. Donald F. Smith, Chairman, Department of Clinical Sciences, New York State College of Veterinary Medicine, Cornell University, Ithaca, NY 14853-6401.**

Cornell University is an equal opportunity/affirmative action employer/educator. (NW3668)A

**University of Sheffield**

**CHAIR OF ORGANIC CHEMISTRY**

Applications are invited for the Chair of Organic Chemistry which will become vacant on 1 October 1990 following the retirement of Professor W D Ollis FRS.

Further particulars from the **Director of Personnel Services, The University, Sheffield S10 2TN** to whom applications (1 copy), including a full curriculum vitae, a list of publications with page numbers and the names and addresses of three referees should be sent by 9 June 1989. Please quote reference number R.883.

An Equal Opportunity Employer

**at the leading edge**

**THE LONDON HOSPITAL MEDICAL COLLEGE  
(University of London)**

**MOLECULAR BIOLOGIST**

Applications are invited for a research assistant position to work on the molecular biology of mycobacterial heat-shock proteins (Nucleic Acids Res. (1988) 16, 9047, J. Gen. Mic. (1989)) (in press).

Experience in expression of recombinant proteins would be an advantage. The project is located in the Department of Medical Microbiology which is well equipped for this type of work and contains several groups engaged in molecular studies. If the successful candidate does not have a PhD and wishes to take a higher degree, they will be particularly encouraged.

For further details, telephone Dr A R M Coates on 01-377 7643. A curriculum vitae with names and addresses of two referees should be sent to **Dr A R M Coates, Dept of Medical Microbiology, London Hospital Medical College, Turner Street, London E1 2AD.**

(9095)A

**THE HANNAH RESEARCH  
INSTITUTE  
DIRECTOR'S RESEARCH  
GROUP  
IMMUNOLOGIST/  
BIOCHEMIST**

Applications are invited for a position in the Director's Research Group to study the autocrine control of milk secretion. The appointee will join a vigorous team which is investigating local modulation of the endocrine control of mammary development and function by autocrine and paracrine mechanisms operating within the gland. The post is funded for 2 years and is available immediately.

Applicants should possess a first or upper second class degree in biochemistry, immunology, or a related discipline, with at least 2 years' relevant experience. Experience in the production of monoclonal antibodies and in radio-immunoassay or enzyme immunoassay development is desirable but not essential.

Appointment will be at Higher Scientific Officer grade, with starting salary up to £10,994. A non-contributory superannuation scheme is operating.

Further details may be obtained from the Secretary, The Hannah Research Institute, AYR KA6 5HL to whom applications, including the names of two referees, should be forwarded by Friday 19 May quoting reference HRI/165. (9114)A

**POSTDOCTORAL  
POSITION**

**Molecular Enzymology  
and Protein Engineering**

Available immediately to study the molecular cloning, mutagenesis and chemical mechanism of action of mammalian phosphatases. Experience with  $\lambda$ , cloning and DNA sequencing is essential. Send curriculum vitae and names of three references to: **Prof. Robert L. Van Etten, Chemistry Department, Purdue University, West Lafayette, IN 47907. Purdue University is an Equal Opportunity/Affirmative Action Employer. (NW3654)A**

**POSTDOCTORAL POSITIONS**

available to conduct research on RFLP analysis of corn and other cereal crops. Applicants should have experience with standard molecular biology techniques. Familiarity with DNA sequencing and PCR technology is desirable. Candidates with a PhD in molecular biology and/or genetics are encouraged to apply. Please send résumé and transcripts to: Sybil Paul, Department of Agronomy, Virginia Polytechnic Institute and State University, Blacksburg, VA24061. Telephone: 703/231-6300. VPI&SU is an Equal Opportunity/Affirmative Action Employer. (NW3670)A

**CYTOGENETICIST MD/Ph.D.**

Physician or pathologist preferred. Specialty certification (or equivalent training) and background in clinical diagnostic and research work important. Funded basic research grant support and evidence of productivity critical. Experience and a record of scholarship with a strong publication record are required. Minimum of two years experience in human cytogenetics necessary. Women and members of minority groups are encouraged to apply. Please forward curriculum vitae to **John E. Craighead, M.D., Department of Pathology, University of Vermont, Burlington, VT 05405.** Applications will be accepted until position is filled. Affirmative Action/Equal Opportunity Employer. ## ROYAL FREE HOSPITAL SCHOOL OF MEDICINE (University of London) JUNIOR RESEARCH FELLOWSHIPS

Applications are invited for six Fellowships from basic science students (in appropriate disciplines) who have, or expect to obtain, first or upper second class degrees and are highly motivated towards research. The conditions of the Fellowships are similar to SERC Ph.D. Research Studentships and are for 3 years from October 1989. They provide a maintenance grant of £3970 per annum. The supervisors and research topics are:

**Dr S.A. Baldwin** (Depts of Biochemistry and Protein & Molecular Biology) **Dr D.W. Wray** (Dept. of Pharmacology)

"Structure, Function and Regulation of a Voltage-Dependent Calcium Channel"

**Prof D. Chapman, FRS** (Dept of Protein & Molecular Biology)

"Protein Folding and Polymerization Processes. Studies of RNAaseT, Mutants and Fibrinogen Using FTIR Spectroscopy"

**Prof B.A. Cooke and Mr S. Parbhoo** (Molecular Endocrinology Group)

"Genetic Expression and Activity of Aromatase in Benign and Malignant Breast Tissue"

**Dr T. Cowen** (Dept of Anatomy)

"Neuronal Ageing: A Study of the Axonal and Dendritic Arborisation of Transmitter-Identified Autonomic Neurons in Old Age"

**Dr E.S. Debnam & Dr S. K. Srai** (Dept of Physiology)

"Isolation and Characterisation of Brush Border Membrane Iron Binding Protein and its Expression in the Developing Guinea Pig"

**Dr M. Jacobs** (Dept of Pharmacology)

"Endothelium-Derived Vaso-Active Factors, Lipoproteins and Atherosclerosis"

Further details from and applications (which should be made as soon as possible) to **The Registrar, The Royal Free Hospital School of Medicine, Rowland Hill Street, London NW3 2PF, Tel 01-794 0500 ext 4258.** (9104)E

## The Queen's University of Belfast POSTDOCTORAL FELLOWSHIPS School of Biology and Biochemistry

A number of fellowships will be available for one to three year periods in the following areas: Biochemistry — (peptide, nucleic acid and immunochemistry), Genetic Engineering — (virology, oncology, microbial, plant molecular biology), Cell and Experimental and Evolutionary Biology — (behaviour, ecology, fish biology and marine biology).

Salary scale (under review): £9,867–£15,720 per annum, with USS, placing depending on age and experience, with USS.

Further information about the School's research programme may be obtained from **Professor S.J. Martin (Belfast (0232) 329241 ext. 2491).**

Applicants, quoting ref. 89/BB, should submit a curriculum vitae, including the names and addresses of three referees to the **Personnel Officer, The Queen's University of Belfast, BT7 1NN, Northern Ireland.** Closing date: 28 May 1989. *The University is an Equal Opportunity Employer.* FEA Registration no. 575. (9115)E

continued on page 32

## STUDENTSIPS

## CENTRAL TOXICOLOGY LABORATORY PhD STUDENTSHIP IN TOXICOLOGY

To work in the Biochemical Toxicology Section to study mechanisms of nephrotoxicity. The student will join a thriving research environment with opportunities to collaborate with other groups in ICI. The project will investigate the metabolic activation of chemicals and their subsequent toxic effect in renal cells. Techniques to be used include cell isolation and culture, enzyme kinetics, identification of metabolites, radiotracer studies and immunocytochemistry. Prospective students should expect to receive a 1st or Upper 2nd class honours degree in biochemistry or a related subject. ICI offers excellent laboratory facilities and will supplement the standard studentship grant with a local living allowance.

Further information from **Dr E A Lock, Imperial Chemical Industries, Central Toxicology Laboratory, Alderley Park, Cheshire, SK10 4TJ.** Telephone 0625 514549, to whom applications should be sent by 31 May 1989. (9139)E

## FELLOWSHIPS continued

### POSTDOCTORAL FELLOWSHIP

NIH Staff Fellow/Senior Staff Fellow position is available at the National Institute on Alcohol Abuse and Alcoholism, for studies of neurotransmitter and hormone receptors and their interactions with cytokines and growth factors. Preference is given to applicants with experience in molecular biology, protein purification and receptor biochemistry/pharmacology. Salary is commensurate with experience. Only U.S. citizens or permanent residents are eligible for this position.

Send CV and name of three references to:

**Dr. George Kunos**  
Laboratory of Physiologic and  
Pharmacologic Studies NIAAA  
12501 Washington Avenue  
Rockville, MD 20852  
Phone: (301) 443-1234

NIAAA IS AN EQUAL OPPORTUNITY EMPLOYER

(NW3647)E

### CLARE HALL CAMBRIDGE

## RESEARCH FELLOWSHIPS ARTS, SOCIAL SCIENCES AND SCIENCES

The Governing Body of Clare Hall proposes to elect two or more non-stipendiary Research Fellows for a period of three years, starting not earlier than October 1989. It is hoped that the fields of study of these Research Fellows shall include both the Arts and Social Sciences and the Sciences (Physical, Biological and Earth Sciences, Mathematics or Technology). There are no restrictions on age, sex or previous standing, except that those who have previously held College Research Fellowships in Oxford or Cambridge are not eligible, and some preference may be given to candidates who are at a fairly early stage of their research career. The closing date for the receipt of applications and references is **30 June 1989**.

Application forms may be obtained (written requests only, with a stamped, addressed envelope) from The College Secretary, Clare Hall, Herschel Road, Cambridge CB3 9AL, UK. (9130)E

### University of Hong Kong Postdoctoral Fellowship in Patch-clamp technique Department of Physiology

Applications are invited from those with experience of patch-clamp technique, for a Cystic Fibrosis Foundation-supported project on the role of ion channels in fluid secretion in the epididymis.

Appointments will commence as soon as possible and is for 2 years. Annual salary is about US\$22,000 with medical benefits provided. A return airfare will also be provided if required. At current rates, income tax will not exceed 15% of gross income.

Send curriculum vitae, statement of research interests, and the names of three referees to: Dr. P.Y.D. Wong, Department of Physiology, Faculty of Medicine, University of Hong Kong, Sassoon Road, Hong Kong. Tel: (852) 5-8199202, Telex: 71919 CEREB HX, Fax: (852) 5-8582549. Closing date May 31, 1989. (W6085)E

### POSTDOCTORAL FELLOWSHIPS IN MOLECULAR BIOLOGY AT HARVARD MEDICAL SCHOOL

Unexpected openings exist in July 1989 for two individuals holding Ph.D. or M.D. degrees for NIH supported postdoctoral training in molecular biology of ion transport proteins. Strong backgrounds in biochemistry required. Only U.S. citizens or permanent residents are eligible. Send curriculum vitae and three references to:

**Dr. Barry M. Brenner,**  
Director, Renal Division,  
Brigham and Women's  
Hospital,  
75 Francis Street, Boston,  
MA 02115

HMS/BWH are equal opportunity employers.

(NW3661)E

## STUDENTSHIPS continued

### University of Southampton

### Department of Neurophysiology

## Postgraduate Studentships in Neuroscience

We have two Research Council studentships, tenable for three years, commencing October 1989, to work towards a Ph.D degree in the following areas:

1/ a CASE SERC studentship with Roussel Laboratories, Swindon, to study long term changes in synaptic function as models for learning and memory in rats, involving electrophysiological and behavioural techniques;

2/ an MRC studentship available in one of the following: the molecular basis of pathological conditions by the expression of neuronal mRNAs in *Xenopus* oocytes; the subcellular organisation of ionic channels in mammalian neurones and its physiological and pathological consequences; the spread of primary afferent depolarization in an in vitro spinal cord preparation.

Candidates should have, or expect to obtain, a first or upper second class honours degree of M.Sc. in one of the biological science disciplines. Applications, including a complete C.V. and names and addresses to two referees should be sent to: **Prof. G.A. Kerkut, Dept. of Neurophysiology, University of Southampton, Southampton SO9 3TU.** (9126)F

### UNIVERSITY OF LIVERPOOL DEPARTMENT OF BIOCHEMISTRY

## RNIB RESEARCH STUDENTSHIP

Applications are invited from candidates who possess or expect to obtain a first or upper second class degree in Biochemistry or a related subject for a Research Studentship funded by the Royal National Institute for the Blind. The student will carry out research into the molecular biology of the vertebrate retina under the supervision of Professor B. E. H. Maden. The stipend is the same as for MRC studentships; however, in addition to the standard bench allowances there is substantial extra funding for consumable materials.

Interested candidates should send a curriculum vitae and the names of two referees to **Professor Maden, Department of Biochemistry, The University, P.O. Box 147, Liverpool, L69 3BX.**

An Equal Opportunity Employer.

(9080)F

### The Queen's University of Belfast RESEARCH STUDENTSHIPS School of Biology and Biochemistry

A number of research studentships will be available, commencing 1st October 1989, in the following areas:

**Biochemistry:** (peptide, nucleic acid and immuno chemistry).

**Genetic Engineering:** (virology, oncology, microbial and plant molecular biology).

**Cell and Experimental Biology:** (parasitology and plant physiology).

**Environmental and Evolutionary Biology:** (behaviour, ecology, fish biology and marine biology).

Applicants should have or expect to obtain at least a 2.1 degree or equivalent qualification in an appropriate biological science subject and be highly motivated for a research career. Applications should be submitted to **The Director, Professor S.J. Martin, School of Biology and Biochemistry, Queen's University, 97 Lisburn Road, Belfast BT9 7BL, Northern Ireland,** and include a curriculum vitae, the names of two referees and a brief description of their research experience. The studentships are available for residents in EEC countries and will carry a stipend of £3,000 pa plus payment of fees. Closing date 30th May, but late applications may be considered. (9116)F

### AFRC INSTITUTE FOR GRASSLAND AND ANIMAL PRODUCTION WELSH PLANT BREEDING STATION ABERYSTWYTH RESEARCH STUDENTSHIP

Applications are invited for an AFRC funded three year PhD studentship to commence in October 1989 for work on genetic and molecular regulation of leaf senescence in mutants of *Arabidopsis thaliana*. The appointee will acquire a range of genetic, biochemical, immunological and

molecular biological skills.

Applicants should hold or expect to obtain a first or upper second class honours degree in Biochemistry, Genetics, Physiology, Cell/Molecular Biology or a related subject. The successful candidate will be registered for a PhD at the University of Wales, Aberystwyth.

Further details and application forms are available from the Personnel Officer, Welsh Plant Breeding Station, Plas Gogerddan, Aberystwyth, Dyfed SY23 3EB. Closing date 31 May 1989.

(9138)F

ROYAL HOLLOWAY AND BEDFORD  
**NEW COLLEGE**  
University of London

DEPARTMENT OF GEOLOGY

## RESEARCH STUDENTSHIP IN STABLE ISOTOPE GEOCHEMISTRY

A 3 year studentship, supported by VG Isogas Ltd, is available for research into the stable isotope geochemistry of fluid processes in the mantle and lower crust. Fluid inclusion geochemistry will be investigated using state-of-the-art gas extraction and mass spectrometric techniques.

The student will be based in the new stable isotope laboratory at RHBNC and will also have opportunities to utilise research and developmental facilities at VG Isogas Ltd. Attendance at international conferences will be encouraged.

The project will be jointly supervised by Dr D P Matthey (RHBNC) and Dr R A Exley (VG Isogas).

Applications, including a brief CV and names of two referees, should be sent to: **Dr D P Matthey, Department of Geology, RHBNC, University of London, Egham Hill, Egham, Surrey. TW20 0EX.** To obtain further information please telephone Egham (0784) 34455 ext. 3587.

(9070)F

DEPARTMENT OF MICROBIOLOGY  
UNIVERSITY OF SOUTHAMPTON

## MRC RESEARCH STUDENTSHIPS

Applications are invited from students who expect to obtain a B.Sc. I or II (i) in Biochemistry, Genetics, Microbiology or related subject for four MRC Research Studentships tenable from 1st October, 1989.

The main interests of the Department are in understanding the molecular basis of microbial pathogenicity. The Department has major funding for research on bacteria (chlamydia, meningococci, gonococci) and viruses (respiratory syncytial, varicella-zoster). Our research programmes are directed towards the development of both vaccines and improved diagnostic reagents for these important infectious agents.

The Department is well equipped and has excellent facilities for advanced techniques in molecular genetics (including automated oligonucleotide synthesis) and immunobiology. The research studentship will involve the integrated application of recombinant DNA technology, protein chemistry, immunology and cell biology. These projects offer an ideal opportunity to gain highly relevant expertise in a spectrum of modern disciplines and comprehensive training will be given.

Further information can be obtained from **Dr I N Clarke (Tel. 0703 777222 Ext. 3886), Department of Microbiology (University), South Laboratory and Pathology Block, Southampton General Hospital, Tremona Road, Southampton SO9 4XY** to whom applications in the form of a full CV and the names of two academic referees should be sent.

(9078)F

UNIVERSITY COLLEGE OF SWANSEA  
School of Biological Sciences

Applications are invited for four NERC funded

## Ph.D. STUDENTSHIPS

available in the Biomedical and Physiological Research Group. Studentships 1, 2 and 3 are to commence in October 1989, 4 is available immediately.

1. Molecular analysis of mutation frequencies in *Mytilus* larvae. (Professor J M Parry and Dr D H Jones).
2. The monitoring of chronic exposure to genotoxic chemicals (CASE award with the Severn-Trent Water Authority). (Professor J M Parry, Dr A F Rowley and Dr R Tye).
3. Mitochondrial DNA polymorphism and fitness characters in marine bivalves. (Dr D O F Skibinski).
4. Natural selection of nuclear and mitochondrial DNA in hybrid *Mytilus* populations. (Dr D O F Skibinski).

The projects will be carried out in a well funded department and students will be provided with the opportunity of training in a wide variety of techniques. Previous experience of techniques of molecular biology are not required but applicants should have enthusiasm for working on interesting scientific problems. Opportunities for postgraduate research are also available in other areas of biology.

Please send requests for further information or letters of application with c.v. to **Dr D O F Skibinski, School of Biological Sciences, University College of Swansea, Swansea SA2 8PP, U.K.** as soon as possible.

Rothamsted Experimental Station

## SERC CASE PhD STUDENTSHIP

Applications are invited from graduates in the biological sciences for a three year studentship for working on the isolation and characterisation of plant cytochrome P450 enzymes involved in herbicide detoxification in resistant plant species. The student will be registered at Royal Holloway and Bedford New College, but will spend equal time at both institutions. The project will be under the supervision of Prof J R Bowyer (RHBNC) and Dr D L Hallahan (RES).

The student will gain experience in plant tissue culture, membrane protein purification (primarily using IPLC), the use of radiochemicals in metabolism studies, spectroscopic analysis and monoclonal antibody technology.

Applications, with the names and addresses of two referees, should be submitted by June 14th to **Professor J R Bowyer, Department of Biochemistry, RHBNC, Egham Hill, Egham, Surrey. TW20 0EX.**

Informal enquiries may be made by telephoning Prof Bowyer (0784 34455 ext. 3803) or Dr Hallahan (05827 63133 ext. 2264). (9117)F

INSTITUTE OF PLANT SCIENCE RESEARCH,  
CAMBRIDGE LABORATORY

## AFRC POSTGRADUATE RESEARCH STUDENTSHIP

Applicants are invited for a postgraduate studentship, which is tenable from 1st October 1989, to work with Dr. George Coupland. The objective of the project is to vary the transcription level of the transposase gene of the maize transposon *Ac* in order to investigate control of transposition frequency in *Arabidopsis*. It is hoped that this analysis will lead to an efficient transposon-tagging system in *Arabidopsis*.

Candidates should have or expect to gain a 1st or 2(i) Honours degree. Further information available on request. Applications with CV and the names of two referees to **Mrs L. Cliff, IPSR Cambridge Laboratory, Maris Lane, Trumpington, Cambridge CB2 2JB**, quoting reference MG/PGF/2 by 15th May. (9137)F

UNIVERSITY OF NEWCASTLE UPON TYNE  
Division of Pathology

## MRC Studentship

Applications are invited for a Ph.D. Studentship to work in one of the following areas: cancer research, human genetics, virology.

Applicants should possess or expect to obtain at least an upper second class Honours degree in biochemistry, biology, genetics, microbiology or a related subject.

Applications together with the names of two referees or enquiries for further particulars should be addressed to: **Professor C H W Horne, Department of Pathology, Royal Victoria Infirmary, Newcastle upon Tyne, NE1 4LP (Tel: 091 2328511 ext. 7144).** (9119)F

University of York

## Research Studentship

'UNSELFISH' B-CHROMOSOMES IN POPULATIONS OF WILD CHIVES

A NERC-funded studentship is available in the Department of Biology for studies on 'unselfish' B-Chromosomes in populations of wild chives (*Allium schoenoprasum*), specifically to investigate the nature of their advantage for the survival of individuals in natural and experimental populations. The studentship will be tenable from October 1989. Applicants should have or expect to obtain at least an upper second class honours degree in an appropriate biological subject.

Applications, including C.V. and the names of two academic referees, should be sent to **Dr. S. M. Bougourd, Department of Biology, University of York, York YO1 5DD.** Further details are available on request.

(9120)F

**UNIVERSITY OF LEICESTER,  
DEPARTMENT OF BIOCHEMISTRY**

**POSTGRADUATE STUDENTSHIPS**

Applications are invited for the following:

**1. SERC/CASE STUDENTSHIP.** "Energy Coupling in DNA Gyrase" — Dr. A. Maxwell. To study the coupling between the free energy of ATP hydrolysis and the introduction of supercoils into DNA by gyrase. The project will involve both molecular biology and enzymology (Supported by Glaxo.)

**2. SERC/CASE STUDENTSHIP.** "Structure and Mechanism of Serine Acetyltransferase" — Prof. W.V. Shaw and Dr. D.B. Wigley. To investigate the relationship between the structure and mechanism of this and other acyl transferases. Techniques will include crystallography, enzymology and site-directed mutagenesis. (Supported by Smith, Kline and French.)

**3. SERC/BIOTECHNOLOGY "EARMARKED" STUDENTSHIP.** "NMR and Mutagenesis Studies of Dihydrofolate Reductase" — Prof. G.C.K. Roberts. To study the role of individual amino-acid residues in the specificity of drug binding to this enzyme; the work will involve site-directed mutagenesis, enzymology and/or nmr spectroscopy.

**4. SERC/BIOTECHNOLOGY "EARMARKED" STUDENTSHIP.** "NMR and Mutagenesis Studies of the *E.coli* Trp Repressor" — Prof. G.C.K. Roberts and Prof. W.J. Brammar. To investigate the mechanism by which this protein recognises specific DNA sequences, using molecular biological and spectroscopic methods.

**5. SERC and MRC** quota studentships in the areas of Biomolecular Structure and Dynamics, Bioconversions and Biotechnology, and Eukaryotic Molecular Biology. Details of individual projects are available on request from Dr. R.A. Cooper.

Further information may be obtained by contacting the persons named above (tel: (0533) 523470). Applications should include a c.v. and the names of two academics referees and should be submitted to **Dr. R.A. Cooper, Department of Biochemistry, University of Leicester, Leicester LE1 7RH.** (9121)F

<b>Dr M Selkirk</b>	Molecular immunology of parasite antigens.
<b>Dr DF Smith</b>	Molecular parasitology of leishmaniasis.
<b>Dr J Tippins</b>	Calcitonin gene-related peptide and vasodilation.
<b>Dr G Wilkin</b>	Astroglial/oligodendroglial cells in the CNS.

Applications with a full CV and details of 2 referees, should be sent as soon as possible to **Dr AG Dickerson, Biochemistry Department, Imperial College, London SW7 2AZ.** (9103)F

**Ludwig Institute for Cancer Research  
St Mary's Branch  
PhD Studentship**

Applications are invited for a 3 year PhD studentship in the field of oncogene research. Our laboratory applies a wide range of molecular and biological techniques to study the molecular aspects of oncogenesis and differentiation with emphasis on function and regulation of expression of the *Mos* proto oncogene. Applicants holding or expecting a good degree in the biological sciences should send a curriculum vitae and the names of two references to **Dr. Friedrich Propst, Ludwig Institute for Cancer Research, St Mary's Medical School, Norfolk Place, London W2 1PG. Tel: 01-724 5522.** (9131)F

*University  
of Reading*

**Appointments**

**SCHOOL OF ANIMAL & MICROBIAL SCIENCES  
STUDENTSHIP**

available to study use of avian primordial germ cells in production of transgenic birds. Applicants should have a good knowledge of experimental embryology or molecular biology. Value £4000/y plus fees for higher degree registration.

**Send c.v. plus names of 2 referees to Professor K. Simkiss, Dept of Pure & Applied Zoology, University of Reading, Whiteknights, P O Box 228, Reading RG6 2AJ.** (9085)F

**AFRC INSTITUTE OF  
ARABLE CROPS  
RESEARCH**

**AFRC RESEARCH STUDENTSHIPS**

Applications are invited for the following AFRC Studentships to commence in October 1989:

1. RFLP analysis, including DNA fingerprinting, of insects resistant and susceptible to insecticides, with Dr A Devonshire and Dr I Denholm, Insecticides Department, IACR-RES.
2. The role of glutamine synthetase in determining the efficiency of symbiotic N-fixation, with Dr B Forde, Biochemistry Department, IACR-RES.
3. Gibberellin receptors and signal transduction in aleurone protoplasts of *Avena fatua* L., with Dr R Hooley, University of Bristol, Department of Agricultural Sciences, IACR-RES.

Projects 1 and 2 are based at IACR-Rothamsted Experimental Station, Harpenden, and project 3 at IACR-Long Ashton Research Station, Bristol.

Applicants should have, or expect to gain, a first or upper second class honours degree. The studentships are tenable for three years and the successful candidates will be registered for an M.Phil or a Ph.D with a relevant University.

Applications, indicating the project selected and giving names and addresses of two referees, should be sent to the Institute Secretary, IACR, Rothamsted Experimental Station, Harpenden, Herts AL5 2JQ, quoting Ref: 795, by 19 May. Informal telephone enquiries can be made to the supervisors named on 0272 392181 for Long Ashton or 05827 63133 for Rothamsted. (9136)F

**UNIVERSITY OF SHEFFIELD  
DEPARTMENT OF MOLECULAR  
BIOLOGY AND BIOTECHNOLOGY**

**STUDENTSHIP IN  
ANTIBODY  
ENGINEERING**

An SERC-funded CASE studentship is available for a suitably qualified graduate to work on a collaborative project of antibody engineering between Dr Dennis Burton and Celltech. The project will use techniques of molecular biology to design antibodies with novel properties.

The studentship is available immediately but start date is negotiable. Applications with a c.v. and names of two referees and informal enquiries should be directed to **Dr Dennis Burton, Department of Molecular Biology and Biotechnology, The University, Sheffield S10 2TN** (tel: 0742 768555 ext 4323). (9084)F

**University of St Andrews  
DEPARTMENT OF BIOLOGY  
& PRECLINICAL MEDICINE  
Studentship in  
Molecular Electronics**

Applications are invited for an SERC Studentship in Molecular Electronics to work on a project to investigate "Properties of small artificial circuits of identifier neurones". Candidates should have or expect to obtain a First or Upper Second Class Degree in a Biological Science. Letters of application enclosing a full Curriculum vitae, which includes the names and addresses of two academic referees, should be sent to **Professor G.A. Cottrell, Department of Biology & Pre-clinical Medicine, Bute Medical Buildings, University of St Andrews, St Andrews, Fife, KY16 9TS**, from whom further particulars are also available. (9097)F

## SEMINARS & SYMPOSIA

### THE THIRD CAMBRIDGE MINI-SYMPOSIUM (a series devoted to the exploration of the molecular and cellular aspects of drug actions).

**JULY 7TH-8TH 1989**

#### "RECEPTOR STRUCTURE AND FUNCTION"

Organised jointly by the Department of Pharmacology, University of Cambridge, the MRC Neurobiology Unit and the Parke-Davis Research Unit. To be held at Churchill College, Cambridge.

In the 1989 Symposium we intend to explore the relationship between the structure and function of both membrane-bound and non membrane-bound proteins. The discussions are intended to range from X-ray and nmr data on receptor structure, enzyme and receptor-ligand interactions, through to functional responses involving, for example, linking to channels and regulatory proteins.

The audience and participants are intended to be multidisciplinary comprising of pharmacologists, biochemists and medicinal chemists.

Invited Speakers include: T. Blundell (London), G. Wagner (Michigan), R. Schwyzler (Zurich), A. Fersht (Cambridge), J. Saunders (M.S.D.), P. Goodford (Oxford), P. Dean (Cambridge), A. Walmsley (Leicester), C. Venter (Rockville), N. Unwin (Cambridge).

Attendance is limited to invited participants selected from those applying as outlined below.

Poster Session. Posters are invited from participants. Please indicate your intention to present a poster and a suggested title with your application.

Registration details: The Registration Fee of £25 covers the meeting and accommodation at Churchill College on 7th July, lunches on 7th and 8th July, breakfast on 8th July and the Symposium Dinner on 8th July.

A limited number of students and post-doctoral workers within three years of qualification will be given free registration and accommodation. In exceptional circumstances, a travel bursary may be available. Applicants for these places and bursaries should enclose a letter of support from their Head of Department.

Please send applications by 12th May enclosing a cheque for £25 payable to Churchill College, Cambridge and a brief résumé of your research interests to:

## COURSES & CONFERENCES

### COLD SPRING HARBOR LABORATORY FALL COURSES

#### Macromolecular Crystallography

**October 11 - 24, 1989**

Alexander McPherson, *University of California, Riverside*

Jim Pflugrath, *Cold Spring Harbor Laboratory*

Crystallography and X-ray diffraction yield a wealth of structural information unobtainable through other methods. This intensive laboratory computational course will focus on the major techniques used to determine the 3-dimensional structures of macromolecules. It is designed for scientists with a working knowledge of protein structure and function, but who are new to macromolecular crystallography. Topics that will be covered include: protein purification, crystallization, crystal characterization, data collection (film and area detector methods), data reduction, anomalous dispersion, phase determination, molecular replacement and averaging, electron density interpretation, structure refinement, molecular graphics, and molecular dynamics. Participants will learn through extensive hands-on experiments, informal discussions and lectures on current applications of these and related procedures given by outside speakers.

#### Molecular Genetics of Fission Yeast

**October 24 - November 6**

David Beach, *Cold Spring Harbor Laboratory*

Peter Fantes, *University of Edinburgh, Scotland*

Jerry Hyams, *University College, London*

Maureen McLeod, *Cold Spring Harbor Laboratory*

The fission yeast is increasingly being used as a model organism for the study of basic aspects of cell biology. The course to be held at Cold Spring Harbor Laboratory October - November, 1989 will introduce the students to all aspects of fission yeast biology, but with particular emphasis on genetic manipulation (both classical and with recombinant DNA) and the use of the organism for the study of cell biology. It is hoped that this course will be particularly valuable because very few laboratories in the United States have substantial experience with fission yeast, in contrast with Western Europe and Japan.

Tuition, room and board ..... \$1315.

Application Deadline: ..... July 15, 1989

Applications and additional information may be obtained from:

## Two forthcoming International Conferences

### ADENOSINE AND ATP

#### Progress in Research and Therapeutic Potential

25th/26th September 1989 — London

In recent years, the discovery of a number of purinoceptor subtypes has prompted an explosion of interest in research on purine nucleosides and nucleotides, e.g. adenosine, ADP, ATP etc. These substances exert potent and selective effects in a variety of tissues, from the nervous system and all types of muscle, to endothelial, epithelial, secretory and immune cells. Intense efforts are currently underway in both academia and industry aimed at developing selective agonists and antagonists for the different subclasses of purinoceptors, and at exploring the therapeutic potential of such compounds. This meeting will review the progress that has been made to date.

### THE PLATELET IN HEALTH AND DISEASE

24th/25th October 1989 — London

This meeting will bring together experts from a variety of backgrounds to discuss the latest evidence for the role that platelets play in both health and disease. Although well established as participants in haemostasis and disorders such as thrombosis and atherosclerosis, there is now a growing recognition that the platelet has both additional physiological and pathophysiological roles. Where possible, the meeting will attempt to identify new avenues for drug development based on current knowledge of platelet function.

For further information about both conferences, please contact:

Renata Duke,

IBC Technical Services Ltd., Bath House (3rd Floor), 56 Holborn Viaduct, London EC1A 2EX

(9107)C

### UNIVERSITY OF LONDON

Royal Postgraduate Medical School and  
University College London

#### MSc in Neuroendocrine Cell Biology

Applications are invited from graduates in medicine or science for entry into this one-year degree course in the Faculty of Medicine. Students will receive training in aspects of neuroscience and endocrinology and emphasis will be placed on neuroendocrine tissues as an integrated system. Modern investigative techniques, including those currently used in molecular biology, neuropharmacology, immunohistochemistry, electron microscopy, tissue/cell culture, neuroanatomy and receptor studies will be covered. Students will work at both institutions and formal teaching, in the form of tutorials, lectures, practical demonstrations and specialist short courses will be conducted by both host departments (Anatomy and Developmental Biology at University College London; Histochemistry at the Royal Postgraduate Medical School). Each student will carry out an extended research project. Award of the MSc degree will be by written examination and submitted dissertation.

Further information and application form may be obtained from Professor J Polak, Department of Histochemistry, Royal Postgraduate Medical School, Hammersmith Hospital, Du Cane Road, London W12 0NN or Professor G Burnstock, Department of Anatomy and Developmental Biology, University College London, Gower Street, London WC1E 6BT. Enquiries may be made to the Course Secretary, (tel: 01-387 7050, ext 3335). (9073)C

### UMIST

#### ESSENTIAL TECHNIQUES IN GENE MANIPULATION A PRACTICAL COURSE — 11-16 SEPTEMBER 1989

This is an intensive practical course designed for people with little or no experience of recombinant DNA techniques. The practical work will cover the following topics:

1. PRINCIPLES OF DNA ISOLATION AND HANDLING: Purification of DNA, restriction analysis, agarose gel electrophoresis, Southern transfer, DNA labelling, hybridisation probing.
2. BASIC CLONING TECHNIQUES: Preparation of plasmid and phage DNA, transformation, in vitro packaging, construction of recombinant DNA molecules, recombinant selection with plasmid and phage vectors.
3. DNA SEQUENCING: Preparation of template DNA, chain termination sequencing, computer-aided sequence analysis.

Additional topics will be demonstrated and discussed in seminars: cDNA synthesis and cloning, genomic libraries, site-directed mutagenesis, preparation and uses of oligonucleotides and peptides, separation of large molecules by OFAGE.

The course is sponsored by Amersham International, BioRad and BHD, and will take place in the teaching and research laboratories of the Applied Molecular Biology Group and Manchester Biotechnology Centre. The fee is £475 + £75 for accommodation.

Application forms from Dr T A Brown, Department of Biochemistry and Applied Molecular Biology, UMIST, P O Box 88, Manchester M60 1QD, UK. Telephone enquiries to 061 236 3311 exts. 2139 or 2159. The course will be limited to 25 participants. (9113)C

## Hoping to change jobs?

The widest selection of international science vacancies is published in *Nature* each week.

Make sure that you are the first to see them by taking your own subscription to *Nature*.

Complete the tear-out card at the back of the magazine and take advantage of our special personal subscription rates.

INTERNATIONAL WEEKLY JOURNAL OF SCIENCE

# ATTENTION LOWRY PROTEIN ASSAY USERS!

## How do you see yourself?

The Pierce BCA<sup>®</sup> Reagent lets you do accurate protein assays without lengthy and unnecessary steps.

*You can save about two weeks time.*

Wish you had some extra time to take that much deserved holiday? Or just more creative time to spend in the lab? When you use the Pierce BCA<sup>®</sup> Protein Assay reagent, that time can be yours—as much as two weeks per year, and more!

your laboratory currently uses the Lowry Protein Assay to run just even separate assays a month, here's how Pierce can help you save 1.5 hours per run—that's two weeks per year!

### HOW MUCH TIME YOU SAVE WITH BCA<sup>®</sup> PROTEIN ASSAY.

7 assays per month  
Save 1.5 hours each = 10.5 hours  
10.5 hours × 12 months = 126 hours  
126 hours = Over 2 weeks!  
SAVE OVER 2 WEEKS EVERY YEAR!

Contact Pierce today to find out more about how our easy-to-use BCA<sup>®</sup> Protein Assay Reagent measures up to the Lowry Assay for accuracy and convenience.

*You're not alone.*

# Phosphatidylinositol PL-C from Boehringer Mannheim

Phosphatidylinositol phospholipase C (from *B. cereus*) for solubilization of phosphatidylinositol anchored membrane proteins and studies of signal transduction

- ★ free from proteases
- ★ essentially free from phosphatidylcholine PL-C and sphingomyelinase
- ★ economic

**5 U (100  $\mu$ l) – Cat. No. 1143 069**

**20 U (400  $\mu$ l) – Cat. No. 1143 077**

For further details on our product range on signal transduction please ask your local representative or
